LIST OF ATTACHMENTS

This page intentionally left blank.

This document is the Final Environmental Impact Report (Final EIR) for the Shadowbox Studios Project (Project). This document, together with the Draft EIR and its technical appendices, comprise the Final EIR. The document has been prepared by the City of Santa Clarita, acting as lead agency, in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code (PRC) Section 21000 *et seq.*) and the CEQA Guidelines (14 California Code of Regulations Section 15000, *et seq.*).

The Final EIR is required under CEQA Guidelines Section 15132 to include the Draft EIR, comments received on the Draft EIR, the responses of the lead agency to significant environmental issues raised by those comments in the review and consultation process, and any other relevant information added by the lead agency (including minor changes to the Draft EIR). A Mitigation Monitoring and Reporting Program (MMRP) is also required; it can be a separate document or, as in this case, included in this Final EIR.

This document provides revisions to the Draft EIR made in response to comments and/or as initiated by the lead agency. These revisions correct, clarify, and amplify the text of the Draft EIR, as appropriate, but do not alter the conclusions of the Draft EIR.

1.1 Project Summary

The Project Site is located on a 93.5-acre site in the southwestern portion of Santa Clarita, in the Newhall Community, approximately 2 miles east of Interstate 5 (I-5), 2 miles west of the Antelope Valley Freeway (State Route 14 [SR-14]), and 2 miles south of the Santa Clara River. The Project Site is situated at the northeastern corner of Railroad Avenue and 13th Street and bounded by 12th Street, Arch Street, and 13th Street on the south; a railroad right-of-way (ROW) and Railroad Avenue on the west; Metropolitan Water District (MWD) ROW on the east; and slopes maintained by the adjacent residential uses to the north.

The Project Applicant, L.A. Railroad 93, LLC, proposes to develop a full-service film and television studio campus on the Project Site that would consist of approximately 475,500 square feet of sound stages; approximately 565,400 square feet of workshops, warehouses, and support uses; approximately 209,300 square feet of production and administrative offices; and approximately 35,600 square feet of catering and other specialty services. Upon completion, the campus would have an overall building area of approximately 1,285,800 square feet.

Eight buildings, which would contain 19 sound stages, would be constructed in the central portion of the Project Site, south of Placerita Creek. A three-story office building and a four-story (five-level), 1,072-space parking structure that includes one subterranean level are proposed in the southwestern corner of the Project Site. In addition, a two-story support building would extend along the remaining portion of the western boundary (i.e., Railroad Avenue) of the Project Site, south of Placerita Creek. Other ancillary and specialty use buildings, including three catering buildings and a mechanical building with a substation, would be located to the east and southeast of the proposed main entrance at the intersection of Arch Street and 13th Street.

The Project would be conditioned to construct a Class I multi-purpose path along the Project frontage on 12th, Arch, and 13th Streets and either (1) pay an in-lieu fee to contribute toward improvements or (2) construct a connection to provide a link for pedestrians and bicyclists between the Project Site and the Jan Heidt Newhall Metrolink Station, which is located approximately 2,500 feet south of the Project Site, and Old Town Newhall dining and

entertainment district. The Class I multi-purpose path would be a completely separate right-of-way for the exclusive use of bicyclists and pedestrians with the path visibly marked.

The Project would be required to comply with the California Building Standards Code (CCR Title 24), as well as the California Green Building Standards (CALGreen) Code (CCR Title 24, Part 11), as adopted by the Santa Clarita Municipal Code, which requires implementation of energy-efficient light fixtures and building materials into the design of new construction projects, as well as high-efficiency plumbing fixtures. Furthermore, the 2022 Building Energy Efficiency Standards (CCR Title 24, Part 6) require newly constructed buildings to meet energy performance standards set by the California Energy Commission. These standards are specifically crafted for new buildings to result in energy efficient performance. In addition, the Project would provide parking spaces with EV charging stations and parking spaces that would be EV-ready pursuant to the requirements of the CALGreen Code. Furthermore, subject to City and other agency approvals, rooftop photovoltaic (PV) systems and solar panels would be installed on all the sound stage buildings and the support building for localized use.

The Project would require the following discretionary actions from the City: (1) certification of the Final EIR; (2) approval of the following permits: a Conditional Use Permit (CUP) for all new development within the Planned Development Overlay and for studio use within the MXN zone, a Minor Use Permit (MUP) for the provision of less than the minimum residential density required in the MXN zone, a Tentative Map (TM) to subdivide the Project Site into five lots, and Oak Tree Permit (OTP) for the encroachment into the protected zone and removal of oak trees; and a Ridgeline Alteration Permit for proposed development activity within 100 feet vertically and/or horizontally from a designated significant ridgeline as identified in the Land Use Element of the General Plan; (3) approval of a Zone Change to modify the boundaries of the Jobs Creation Overlay Zone (JCOZ) to incorporate the portion of the Project Site zoned MXN, south of Placerita Creek, and to change the zoning of the northern portion of the site from NU5 to MXN; and (4) approval of a General Plan Amendment to modify the General Plan Land Use Designation from NU5 to MXN to remain consistent with the proposed Zone Change and to make text changes to the discussion regarding the North Newhall Area, as discussed in the Land Use Element of the General Plan, to address allowable development potential and building height in the area.

1.2 Public Review Process

The City prepared the Draft EIR to inform decisionmakers and the public of the potential significant environmental effects associated with the Project. The Draft EIR was circulated for public review and comment for 45 days, from April 6, 2023, through May 22, 2023. A Public Notice of Availability (NOA) of the Draft EIR was mailed to all organizations and individuals previously requesting notice and was published in The Signal on April 6, 2023. The City also submitted the complete Draft EIR with appendices to the State Clearinghouse and filed the NOA with the Los Angeles County Clerk for posting during the Draft EIR comment period. In addition, the City presented the Project at three City of Santa Clarita Planning Commission meetings on April 18, 2023, May 16, 2023, and June 20, 202, to solicit comments from the public and the Planning Commission on the Draft EIR. The presentation provided an overview of the CEQA process, description of the Project, and identified environmental impacts, required mitigation measures, and alternatives to the Project that were evaluated in the Draft EIR. Public comments were received regarding the Project at both Planning Commission meetings. The Draft EIR and Final EIR, and associated appendices were made available for review online at: https://www.santa-clarita.com/city-hall/departments/

community-development/planning-division/environmental-impact-reports-under-review/shadowbox-studios-project and a limited number of hard copies of the Draft EIR were available at the City Clerk's Office at Santa Clarita City Hall and the City of Santa Clarita Old Town Newhall Library. The video presentations for the three Planning Commission meetings are also available online at the following:

- April 18, 2023: http://santaclaritacityca.iqm2.com/Citizens/SplitView.aspx?Mode=Video&MeetingID=2791&Format=Agenda
- May 16, 2023: http://santaclaritacityca.iqm2.com/Citizens/SplitView.aspx?Mode=Video&MeetingID=2793& Format=Agenda
- June 20, 2023: http://santaclaritacityca.iqm2.com/Citizens/SplitView.aspx?Mode=Video&MeetingID=2795&Format=Agenda

Interested persons and organizations had the opportunity to submit their written comments on the Draft EIR during the 45-day public review period. Comment letters received on the Draft EIR, reproduced in their entirety, and responses to those comments are provided in this Final EIR.

CEQA Guidelines Section 15088(c) specifies that the focus of the responses to comments must be on the disposition of significant environmental issues. Responses are not required for comments regarding the merits of the Project or on issues not related to potential physical environmental impacts and/or the Draft EIR's analysis of such impacts. Comments on the merits of the Project or other comments that do not raise environmental issues are nevertheless included in the record for consideration as part of the Project's approval process. The responses address environmental issues and indicate where issues raised do not pertain to environmental impacts or analysis. In the latter instance, no further response is provided.

Only minor changes to the text of the Draft EIR occurred since public circulation, and none of the changes constitute "significant new information," which would require its recirculation. "Significant new information" is defined in CEQA Guidelines Section 15088.5(a) as follows:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

None of these circumstances have arisen from comments on the Draft EIR; therefore, recirculation is not required.

1.3 Review and Recommended Certification of the Final EIR

As required by PRC Section 21092.5 and CEQA Guidelines Section 15088(b), at least 10 days before consideration of the Final EIR for certification by the City of Santa Clarita City Council, the City provided written responses (hard or electronic copy) to each public agency that submitted written comments on the Draft EIR. In addition, responses are also being distributed to all commenters who provided an address. The Final EIR is available for public review at the following locations:

- City of Santa Clarita, Office of the City Clerk, 23920 Valencia Boulevard, Suite 302, Santa Clarita, California, 91355
- City of Santa Clarita Old Town Newhall Library, 24500 Main Street, Santa Clarita, CA 91321
- City's website: https://www.santa-clarita.com/city-hall/departments/community-development/planning-division/environmental-impact-reports-under-review/shadowbox-studios-project

1.4 Organization of the Final EIR

This Final EIR is organized into four sections as follows:

Introduction. This section (above) provides introductory information about the Project and the CEQA review process.

Comments on the Draft EIR and Responses. This section presents all comments received by the City during the 45-day public review period for the Draft EIR (April 6, 2023, through May 22, 2023), as well as responses to those comments.

Errata and Clarifications to the Draft EIR. This section consists of minor revisions and clarifications to the Draft EIR in response to comments received.

Mitigation Monitoring and Reporting Program. This section provides the full MMRP for the Project. The MMRP lists the mitigation measures by environmental topic and identifies the method of review verification, responsible agency, and timing for each measure.

This section provides a list of commenters and copies of the comments received with responses to those comments.

2.1 List of Commenters

Table 2.1-1, List of Commenters on the Draft EIR, assigns a number to identify the commenter and notes the general topic area covered by each comment letter.

2.2 Comments and Responses to Comments

This subsection includes copies of the comment letters received on the Draft EIR, as identified in Subsection 2.1, List of Commenters, with the comments numbered for reference and responses to the comments.

Attachment 1 also includes the letters that requested an extension of the Draft EIR public review period, express support for or opposition to the Project, or provide suggestions and opinions on the merits of the Project or components of the Project. As these letters do not address the adequacy of the Draft EIR, no responses were provided. However, these letters have been included in the records and forwarded to the decision-makers for consideration.

Subject: Shadowbox Studios Project, Draft Environmental Impact Report, SCH #2022030762, City of Santa Clarita Planning Division, Los Angeles County

Dear Ms. Iverson:

The California Department of Fish and Wildlife (CDFW) has reviewed the Draft Environmental Impact Report (DEIR) from the City of Santa Clarita Planning Division (City) for the Shadowbox Studios Project (Project). CDFW appreciates the opportunity to provide comments regarding aspects of the Project that could affect fish and wildlife resources and be subject to CDFW's regulatory authority under the Fish and Game Code.

CDFW's Role

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & G. Code, §§ 711.7, subdivision (a) & 1802; Pub. Resources Code, § 21070; California Environmental Quality Act (CEQA) Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect State fish and wildlife resources. **A1-1**

CDFW is also submitting comments as a Responsible Agency under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may **A1-2**

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

LETTER A1 Continued

need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 *et seq.*). Likewise, to the extent implementation of the Project as proposed may result in "take", as defined by State law, of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 *et seq.*), or CESA-listed rare plant pursuant to the Native Plant Protection Act (NPPA; Fish & G. Code, §1900 *et seq.*), CDFW recommends the Project Applicant obtain appropriate authorization under the Fish and Game Code.

A1-2 Continued

Project Description and Summary

Objective: The Project proposes to develop a full-service film and television studio campus on a 93.5-acre site and would consist of sound stages, workshops, warehouses, offices, and catering services. Upon completion, the campus would have an overall building area of approximately 1,285,800 square feet. The Project would involve the construction of 19 sound stages, a large support building, a parking structure, an office building, a catering building, and a mechanical building south of Placerita Creek.

Landscaping

The Project proposes to landscape approximately 13 percent of the Project site throughout the studio campus. The construction of the studio buildings and surrounding landscaping will include the removal of 13 of the 16 oak trees present on site. The Project would replace the removed trees with 450 trees of different non-oak varieties, and 211 oak trees throughout the campus.

A1-3

The Project would also install a plant nursery along the entire length of the parking lot along the eastern boundary of the Project site to provide plants for use on the sound stages and as visual screening from the neighborhood. The Project would also include a small private park in the center of a courtyard, picnic areas, outdoor break areas, and a small dog park throughout the campus.

Access and Parking

A main parking structure would be installed in the southwestern corner of the Project site, with supplemental parking throughout the entire campus. An additional employee parking lot is proposed on the north side of Placerita Creek, which would be connected to the main campus by an all-weather bridge. The current design of this all-weather bridge will necessitate the

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

installation of piers within the streambed, as well as additional bank stabilization features. These stabilization features may include buried revetments, retaining walls, weirs, and other structures within Placerita Creek. The Project would also construct a clearly marked multi-purpose path along 12th, Arch, and 13th Street for the exclusive use of bicyclists and pedestrians.

Off-Site Improvements

The Project proposes additional off-site improvements including the widening of 13th Street Arch Street, and 12th Street; the installation of public hydrants; improvements to the railroad crossing at 13th Street; and the implementation of storm drain improvements to accommodate surface water runoff from Dockweiler Drive. These improvements also include the installation of a pedestrian and bike bridge from the Jan Heidt Newhall Metrolink Station on Railroad Avenue to the future extension of Dockweiler Drive across Newhall Creek.

A1-3
Continued

Location: The Shadowbox Studios Project would be located in the southwestern portion of the City of Santa Clarita in the Newhall Community in Los Angeles County. The Project site is located at the northeastern corner of Railroad Avenue and 13th Street, bounded by 12th Street, Arch Street, and 13th Street on the south, a railroad right-of-way and Railroad Avenue on the west, Metropolitan Water District right-of-way on the east, and slopes maintained by the adjacent residential area to the north.

Comments and Recommendations

CDFW offers the comments and recommendations below to assist the City in adequately avoiding and/or mitigating the Project's significant, or potentially significant, direct, and indirect impacts on fish and wildlife (biological) resources. CDFW recommends the measures or revisions below be included in a science-based monitoring program that contains adaptive management strategies as part of the Project's CEQA mitigation, monitoring, and reporting program (Pub. Resources Code, § 21081.6; CEQA Guidelines, § 15097).

A1-4

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

Specific Comments

Comment #1: Impacts on Crotch's Bumble Bee (*Bombus crotchii*)

Issue: The Project may impact suitable habitat for Crotch's bumble bee (*Bombus crotchii*), a candidate CESA-listed species. The DEIR does not discuss or provide mitigation measures to reduce the impact to Crotch's bumble bee.

Specific impacts: The Project may result in the temporal and permanent loss of suitable nesting and foraging habitat of Crotch's bumble bee. Construction and ground-disturbing activities may cause death or injury of adults, eggs, and larvae; burrow collage; nest abandonment; and reduced nest success.

Why impacts would occur: A review of iNaturalist (iNaturalist 2023), shows over one hundred observations of Crotch's bumble bee throughout Los Angeles County. Furthermore, the Project site has a variety of habitats that have potential to provide foraging and overwintering sites for this candidate species. Crotch's bumble bee primarily nest in late February through late October underground in abandoned small mammal burrows but may also nest under perennial bunch grasses or thatched annual grasses, under-brush piles, in old bird nests, and in dead trees or hollow logs (Williams et al. 2014; Hatfield et al. 2018). Overwintering sites utilized by Crotch's bumble bee mated queens include, soft, disturbed soil (Goulson 2010), or under leaf litter or other debris (Williams et al. 2014). Ground disturbance and vegetation removal from the Project during the breeding season could result in the incidental loss of breeding success or otherwise lead to nest abandonment in areas within and adjacent to the Project site. In addition to potential habitat loss, human disturbance, heavy machinery, and construction activities may result in direct Crotch's bumble bee. The DEIR does not discuss the species or the Project's impact on Crotch's bumble bee. Additionally, the DEIR does not provide species-specific avoidance and minimization measures. Without avoidance, minimization, or mitigation measures, Project activities will result in significant impacts to Crotch's bumble bee.

A1-5

Evidence impact would be significant: The California Fish and Game Commission accepted a petition to list the Crotch's bumble bee as endangered under CESA, determining the listing "may be warranted" and advancing the species to the candidacy stage of the CESA listing process. The Project may substantially reduce and adversely modify habitat as well as reduce and potentially impair the viability of populations of Crotch's bumble bee. In addition, Crotch's bumble bee has a State ranking of S1/S2. This means

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

that the Crotch's bumble bee is considered critically imperiled or imperiled and is extremely rare (often 5 or fewer populations). Lastly, Crotch's bumble bee is listed as an invertebrate of conservation priority under the California Terrestrial and Vernal Pool Invertebrates of Conservation Priority (CDFW 2017). The Project's impact on Crotch bumble bee has yet to be mitigated. Accordingly, the Project continues to have a substantial adverse effect, either directly or through habitat modifications, on a species identified as a candidate, sensitive, or special status species by CDFW.

Recommended Potentially Feasible Mitigation Measure(s):

Recommendation #1: The DEIR should provide full disclosure of the presence of Crotch's bumble bee within the Project site. The DEIR should analyze the Project's impact on floral resources, nesting habitat, and overwintering habitat for Crotch's bumble bee. Conclusions made in regard to habitat quality and suitability should be substantiated by scientific and factual data, which may include maps, diagrams, and similar relevant information sufficient to permit full assessment of significant impacts by reviewing agencies. Potential direct and indirect impacts on Crotch's should be discussed in the DEIR. If the Project would impact Crotch's bumble bee and its associated habitat, the DEIR should provide measures to avoid and/or mitigate potential impacts to Crotch's bumble bee and habitat supporting the species.

A1-5
Continued

Mitigation Measure #1: If the Project site has suitable foraging or nesting habitat for Crotch's bumble bee, the City should retain a qualified entomologist with the appropriate take authorization to conduct surveys to determine presence/absence. Surveys should be conducted within one year prior to vegetation removal and/or grading throughout the entire Project site by a qualified entomologist familiar with the species' behavior and life history. A minimum of three surveys should also be conducted during peak flying season when the species is most likely to be detected above ground, between March 1 to September 1 (Thorp et al. 1983). The qualified entomologist should utilize a non-lethal survey methodology and obtain appropriate photo vouchers for species confirmation (CBBA 2023). During the surveys, the entomologist should flag inactive small mammal burrows and other potential nest sites to reduce the risk of take. Survey results, including negative findings, should be submitted to CDFW prior to obtaining appropriate permits. At minimum, a survey report should provide the following:

a) A description and map of the survey area, focusing on areas that could provide suitable habitat for Crotch's bumble bee. CDFW recommends the

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

map show surveyor(s) track lines to document that the entire site was covered during field surveys.

b) Field survey conditions that should include name(s) of qualified entomologist(s) and brief qualifications; date and time of survey; survey duration; general weather conditions; survey goals; and species searched.
c) Map(s) showing the location of nests/colonies.
d) A description of physical (e.g., soil, moisture, slope) and biological (e.g., plant composition) conditions where each nest/colony is found. A sufficient description of biological conditions, primarily impacted habitat, should include native plant composition (e.g., density, cover, and abundance) within impacted habitat (e.g., species list separated by vegetation class, density, cover, and abundance of each species).

Mitigation Measure #2: If Crotch's bumble bee is detected, the qualified entomologist should identify the location of all nests within and adjacent to the Project site. A 15-meter no disturbance buffer zone should be established around any identified nest(s) to reduce the risk of disturbance or accidental take. A qualified entomologist should expand the buffer zone as necessary to prevent disturbance or take.

Mitigation Measure #3: If Crotch's bumble bee is detected and impacts to Crotch's bumble bee cannot be feasibly avoided, the City should consult with CDFW and obtain appropriate take authorization from CDFW (pursuant to Fish & Game Code, § 2080 et seq). Appropriate authorization from CDFW under CESA may include an Incidental Take Permit (ITP) or a Consistency Determination in certain circumstances, among other options [Fish & Game Code, §§ 2080.1, 2081, subds. (b) and (c)]. Early consultation is encouraged, as significant modification to the Project and mitigation measures may be required to obtain an ITP. Revisions to the Fish and Game Code, effective January 1998, may require that CDFW issue a separate CEQA document for the issuance of an ITP for the Project unless the Project's CEQA document addresses all the Project's impact on CESA endangered, threatened, and/or candidate species. The Project's CEQA document should also specify a mitigation monitoring and reporting program that will meet the requirements of an ITP. It is important that the take proposed to be authorized by CDFW's ITP be described in detail in the Project's CEQA document. Also, biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for an ITP. However, it is worth noting that mitigation for the Project's impact on a CESA endangered, threatened, and/or candidate species proposed in the

A1-5
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

Project's CEQA document may not necessarily satisfy mitigation required to obtain an ITP.

Mitigation Measure #4: Any floral resource associated with Crotch's bumble bee that will be removed or damaged by the Project should be replaced at no less than 1:1. Floral resources should be replaced as close to their original location as is feasible. If active Crotch's bumble bee nests have been identified and floral resources cannot be replaced within 200 meters of their original location, floral resources should be planted in the most centrally available location relative to identified nests. This location should be no more than 1.5 kilometers from any identified nest. Replaced floral resources may be split into multiple patches to meet distance requirements for multiple nests. These floral resources should be maintained in perpetuity and should be replanted and managed as needed to ensure the habitat is preserved.

A1-5
Continued

Comment #2: Impacts on Mountain Lion (*Puma concolor*)

Issue: The Project may impact suitable habitat for mountain lion (*Puma concolor*), a candidate CESA-listed species. The DEIR does not discuss or provide mitigation measures to reduce the impact to mountain lion.

Specific impacts: The Project as proposed may impact mountain lion by grading and developing at least 93.5 acres of habitat. The Project may also impact mountain lion by restricting movement corridors, and increasing human presence and associated traffic, noise, and lighting.

Why impacts would occur: The Project is located within the range of the Southern California/Central Coast Evolutionary Significant Unit of mountain lion. As stated in the Biological Resources Assessment prepared for the DEIR, "Placerita Creek may provide movement pathways for mobile species such as mule deer and coyote."

A1-6

Habitat loss and fragmentation due to roads and development has driven the southern California mountain lion population towards extinction (Yap *et al*. 2019). Loss of wildlife connectivity is another the primary driver for the potential demise of the southern California mountain lion population (Yap *et al*. 2019). The SGSB mountain lion population likely has high risk of inbreeding depression and extinction given its low genetic diversity, low effective population size, and patterns of isolation due to roads and development creating movement barriers (Center for Biological Diversity 2019). Conserving and restoring habitat connectivity and corridors is essential for mitigating impacts to mountain lions.

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

This is especially critical in the face of climate change-driven habitat loss and increased frequency of fires (Yap *et al*. 2019).

Increased frequency of wildfires is also a threat to the survival of the Southern California/Central Coast ESU of mountain lion (Center for Biological Diversity 2019). Increased human activities next to open spaces with natural vegetation increase the likelihood that fires may start and spread to the adjacent Quigley Canyon Open Space. Fire could also result in injury or mortality of mountain lions (Center for Biological Diversity 2019). For instance, After the Woolsey Fire, the body of mountain lion P-64 was found dead with severely burned paws (Center for Biological Diversity 2019).

The DEIR does not discuss the species or the Project's impact on mountain lion. Additionally, the DEIR does not provide species-specific avoidance and minimization measures. Without avoidance, minimization, or mitigation measures, Project activities will result in significant impacts to mountain lion.

Evidence impact would be significant: The mountain lion is a specially protected mammal in the State (Fish and G. Code, § 4800). In addition, on April 21, 2020, the California Fish and Game Commission accepted a petition to list an evolutionarily significant unit of mountain lion in southern and central coastal California as threatened under CESA (CDFW 2020a). As a CESA candidate species, the mountain lion in southern California is granted full protection of a threatened species under CESA. Take of any endangered, threatened, candidate species that results from the Project is prohibited, except as authorized by State law (Fish & G. Code, §§ 86, 2062, 2067, 2068, 2080, 2085; Cal. Code Regs., tit. 14, § 786.9).

A1-6
Continued

As to CEQA, the status of mountain lion as a threatened species under CESA qualifies it as an endangered, rare, or threatened species under CEQA (CEQA Guidelines, §15380). No mitigation has been proposed for impacts on mountain lion from the Project from the standpoint of habitat loss and encroachment, as well as anthropogenic impacts discussed above.

Accordingly, the Project could have a substantial adverse direct, indirect, and cumulative effect, either directly or through habitat modifications, on a species identified as a candidate, sensitive, or special status species by CDFW. In addition, the Project has a substantial adverse effect on the movement of resident or migratory wildlife species, resident or migratory wildlife corridors, or wildlife nursery sites.

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

Recommended Potentially Feasible Mitigation Measure(s):

Recommendation #2: The City should revise the Project's CEQA document in order to provide additional analyses and information on the Project's impact and cumulative effects on mountain lion. The City should discuss the Project's potential impact on mountain lion from the standpoint of the following impacts:

1. Introducing new/additional barriers to dispersal;
2. Constraining wildlife corridors and pinch points leading to severed migration;
3. Provide an analysis of current landscape intactness (current level of development) around the Project site, and how the Project may impact habitat connectivity or impede mountain lion movement across the landscape to remaining adjacent habitats.
4. Use of herbicides, pesticides, and rodenticides.

A1-6 Continued

A cumulative impact analysis should evaluate potential impacts on mountain lion including: the introduction of new/additional barriers to dispersal; constraint of wildlife corridors and pinch points leading to severed migration; habitat loss, fragmentation, and encroachment; and increased human-wildlife interactions.

Mitigation Measure #5: If take or adverse impacts to mountain lion cannot be avoided, the City should consult with CDFW and obtain appropriate take authorization from CDFW (pursuant to Fish & Game Code, § 2080 *et seq*.). The City should comply with the mitigation measures detailed in the take authorization issued by CDFW. The City should provide a copy of a fully executed take authorization prior to the City issuing the Project grading permits and related building permits.

Mitigation Measure #6: The City should prohibit use of any rodenticides and second-generation anticoagulant rodenticides on the property in perpetuity. The City should provide documentation and a plan that rodenticides and second-generation anticoagulant rodenticides will be prohibited.

Comment #3: Impacts on Coastal California Gnatcatcher (*Polioptila californica californica*)

A1-7

Issue: The Project may impact coastal California gnatcatcher (*Polioptila californica californica*), an Endangered Species Act (ESA)-listed species and a California Species of Special Concern (SSC).

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

Specific impacts: The Project could result in temporary or permanent impacts to coastal California gnatcatcher through alteration or loss of suitable nesting and foraging habitat. Project activities occurring during the breeding and nesting season could also result in the incidental loss of fertile eggs or nestlings.

Why impacts would occur: Coastal California gnatcatcher have potential to occur at the Project site. The DEIR offered protocol presence/absence surveys; however, the document did not offer mitigation for habitat that may be lost or altered due to the construction of the proposed Project. Habitat loss and fragmentation are key factors in population loss and species extinction in a multitude of species (Vandergast 2019).

Nesting sites for coastal California gnatcatcher are often found within sagebrush, buckwheat, or other scrub species located on gentle slopes or drainages (USFWS 1997). The Project site contains approximately 17.5 acres of appropriate coastal sage scrub vegetation which could be impacted by Project activities. Direct and indirect impacts may occur as a result of ground disturbance; vegetation clearing; use of construction equipment and vehicles; increased foot traffic; and introduction of invasive plant species. Species within the potentially impacted natural community include black sage (*Salvia mellifera*), California buckwheat (*Erigonum fasciculatum*), California sagebrush (*Artemisia californica*), big sagebrush (*Artemisia tridentata*), and ashy-leaved buckwheat (*Eriogonum cinereum)*. These plant species and natural communities are vital for the persistence of coastal California gnatcatcher within Los Angeles County. Moreover, the risk of local extirpation is heightened following major habitat disturbances such as fires and drought. Both disturbance events have increased in frequency and severity in southern California.

A1-7
Continued

Evidence impact would be significant: The Project could result in impacts on coastal California gnatcatcher. As an ESA-listed species, gnatcatcher is considered an endangered, rare, or threatened species under CEQA (CEQA Guidelines, § 15380). An SSC is a species, subspecies, or distinct population of an animal native to California that currently satisfies one or more of the following (not necessarily mutually exclusive) criteria:

- is extirpated from the State or, in the case of birds, is extirpated in its primary season or breeding role;
- is listed as ESA-, but not CESA-, threatened, or endangered; meets the State definition of threatened or endangered but has not formally been listed;

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

- is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for State threatened or endangered status; and/or,
- has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for CESA threatened or endangered status (CDFW 2022b).

CEQA provides protection not only for ESA and CESA-listed species, but for any species including but not limited to SSC which can be shown to meet the criteria for State listing. These SSC meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines, § 15380). Take of coastal California gnatcatcher could require a mandatory finding of significance (CEQA Guidelines, § 15065). Take under the ESA is more broadly defined than CESA. Take under ESA also includes significant habitat modification or degradation that could result in death or injury to a listed species by interfering with essential behavioral patterns such as breeding, foraging, or nesting.

Thus, the Project may still have a substantial adverse direct, indirect, and cumulative effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW and USFWS.

A1-7
Continued

Recommended Potentially Feasible Mitigation Measure(s):

Mitigation Measure #8: CDFW recommends the continued survey for coastal California gnatcatcher to determine presence/absence within or adjacent to suitable or designated critical habitat in the Project site. The City should retain a qualified biologist with an appropriate USFWS permit to survey the Project site. The qualified biologist should conduct surveys according to USFWS Coastal California Gnatcatcher (Polioptila californica californica) Presence/Absence Survey Guidelines (USFWS 1997). The survey protocol requires a minimum of six surveys to be conducted at least one week apart from March 15 through June 30 and a minimum of nine surveys at least two weeks apart from July 1 through March 14. The protocol should be followed for all surveys unless otherwise authorized by the USFWS in writing. CDFW recommends gnatcatcher surveys be conducted and USFWS notified (per protocol guidance) prior to issuance of a grading permit.

Mitigation Measure #9: If coastal California gnatcatcher is present, the City should consult with the USFWS to determine if the Project would result in take of coastal California gnatcatcher. Consultation with the USFWS, in order to comply

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

with the ESA, is advised well in advance of any ground-disturbing activities and/or vegetation removal that may impact gnatcatcher.

If a take permit from the USFWS is needed, the City should comply with the mitigation measures detailed in a take permit issued from USFWS.

A1-7 Continued

Comment #3: Impacts on Streams and Associated Natural Communities

Issue: The Project may have a significant impact on streams and associated natural communities.

Specific impacts: The Project would result in permanent and/or temporal loss of streams and associated natural communities. Ground-disturbing activities resulting in erosion and earth movement that could impair streams, whether ephemeral, intermittent, or perennial. The Project may require streams to be channelized or diverted from their natural course of flow. The Project may require vegetation along streams to be removed or may degrade vegetation along streams through habitat modification (e.g., loss of water source, encroachment, and edge effects leading to introduction of non-native plants).

Why impacts would occur: According to pages 4.3-6 through 4.3-22 in the DEIR, the Project would impact Placerita Creek and two unnamed ephemeral drainages (western and eastern). A total of 12.08 acres of streambed and associated riparian habitat occur on the Project site. Approximately 4.4 acres of Placerita Creek would be impacted from the proposed Project activities and a combined total of 2.26 acres of permanent impacts to the unnamed ephemeral drainages.

A1-8

The DEIR provides Mitigation Measure MM-BIO-5 that would require the City to propose compensatory mitigation for temporary and permanent impacts to land subject to the jurisdiction of CDFW at a minimum ratio of 1:1. However, the Project's impact on streams and associated natural communities has yet to be mitigated below a level of significance. First, the Project does not recommend the avoidance of impacts to any streams or propose a setback distance from the streams present on site. In Mitigation Measure MM-BIO-1, the proposed avoidance only pertains to the standard Best Management Practices (BMPs) to prevent hazardous substance leakages into wetlands. It is unclear if and how the Project would be configured to avoid streams and associated natural communities. Second, the construction of a bridge with piers within the streambed, and the installation of undescribed streambank stabilization measures are not sufficiently analyzed in order to fully understand whether these

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

LETTER A1 Continued

activities may be considered a substantial impact on streams and associated natural communities. Within Section 4.9 (Hydrology and Water Quality) of the DEIR, there is no discussion specifically addressing how the potential bridge design and bank stabilization measures may permanently alter the existing drainage pattern of Placerita Creek. The introduction of these impervious surfaces to the existing hydrological processes may result in increased scour and deposition of sediment downstream. Additionally, the DEIR did not provide a jurisdictional delineation or impacts analysis for the modifications proposed to the Dockweiler Drive Extension Project, which includes the installation of a pedestrian and bike bridge from the Jan Heidt Newhall Metrolink Station on Railroad Avenue to the future extension of Dockweiler Drive. Lastly, MM-BIO-5 proposes compensatory mitigation at 1:1, which may be insufficient for significant impacts on a regionally diminishing resource that provides significant and essential habitat and migration corridors for wildlife. In addition, 1:1 may be insufficient for impacts on a Sensitive Natural Community adjacent to a stream. A higher ratio may be necessary to compensate for the rarity of the vegetation community, local significance of wetland features, and the uncertainties when creating or restoring vegetation communities and their complex abiotic interactions.

A1-8
Continued

Evidence impacts would be significant: The Project may impact streams and associated natural communities. CDFW exercises its regulatory authority as provided by Fish and Game Code section 1600 *et seq*. to conserve fish and wildlife resources which includes rivers, streams, or lakes and associated natural communities. Fish and Game Code section 1602 requires any person, state or local governmental agency, or public utility to notify CDFW prior to beginning any activity that may do one or more of the following:

- Divert or obstruct the natural flow of any river, stream, or lake[1];
- Change the bed, channel, or bank of any river, stream, or lake;
- Use material from any river, stream, or lake; or
- Deposit or dispose of material into any river, stream, or lake.

CDFW requires an LSA Agreement when a Project activity may substantially adversely affect fish and wildlife resources.

For reasons discussed above, the Project continues to have a substantial

[1] "Any river, stream, or lake" includes those that are dry for periods of time (ephemeral/episodic) as well as those that flow year-round (perennial). This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a water body.

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

LETTER A1 Continued

adverse effect on state or federally protected wetland (e.g., marsh, vernal pool, and coastal) through direct removal, filling, hydrological interruption, or other means.

Recommended Potentially Feasible Mitigation Measure(s):

Recommendation #5: CDFW's issuance of an LSA Agreement for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the CEQA document from the lead agency/project applicant for the Project. To minimize additional requirements by CDFW pursuant to Fish and Game Code section 1600 et seq. and/or under CEQA, a Project's CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of an LSA Agreement. To compensate for any on- and off-site impacts to aquatic and riparian resources, additional mitigation conditioned in any LSA Agreement may include the following: erosion and pollution control measures; avoidance of resources; protective measures for downstream resources; on- and/or off-site habitat creation; enhancement or restoration; and/or protection and management of mitigation lands in perpetuity.

A1-8
Continued

CDFW recommends the City incorporate the following recommended mitigation measures into Mitigation Measure MM-BIO-5:

Mitigation Measure #11: The City should notify CDFW pursuant to Fish and Game Code section 1602 for construction and activities occurring near or impacting streams and associated natural communities. The City should notify CDFW prior to any ground-disturbing activities and vegetation removal, including staging, near streams. The notification to CDFW should provide the following information:

1) A stream delineation in accordance with the U.S. Fish and Wildlife Service wetland definition adopted by CDFW[2] (Cowardin et al. 1979);
2) Linear feet and/or acreage of streams and associated natural communities that would be permanently and/or temporarily impacted by the Project. This includes impacts as a result of routine maintenance and fuel modification. Plant community names should be provided based on vegetation association and/or alliance per the Manual of California Vegetation;

[2] Be advised that some wetland and riparian habitats subject to CDFW's authority may extend beyond the jurisdictional limits of the U.S. Army Corps of Engineers' Section 404 permit and Regional Water Quality Control Board Section 401 Certification.

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

3) A discussion as to whether impacts on streams within the Project site would impact those streams immediately outside of the Project site where there is hydrologic connectivity. Potential impacts such as changes to drainage pattern, runoff, and sedimentation should be discussed; and
4) A hydrological evaluation of the 100-year storm event to provide information on how water and sediment is conveyed through the Project site. Additionally, the hydrological evaluation should assess a sufficient range of storm events (e.g., 100, 50, 25, 10, 5, and 2-year frequency storm events) to evaluate water and sediment transport under pre-Project and post-Project conditions.

A1-8 Continued

Mitigation Measure #12: If the Project would impact streams and associated natural communities, the City should obtain an LSA Agreement prior to any ground-disturbing activities and vegetation removal, including staging, near streams.

Mitigation Measure #13: The City should provide compensatory mitigation at no less than 3:1 for impacts to streams and associated natural communities, or at a ratio acceptable to CDFW per an LSA Agreement.

Comment #4 Impacts on California Species of Special Concern

Issue: The Project may impact species of special concern (SSC).

Specific impacts: Project construction and activities, directly or through habitat modification, may result in direct injury or mortality (trampling, crushing), reduced reproductive capacity, population declines, or local extirpation of an SSC. Loss of foraging, breeding, or nursery habitat for an SSC may also occur as a result of the Project. Moreover, the installation of a bridge structure streambank stabilization of Placerita Creek may diminish on-site and downstream water quality. Increased sediment loads due to these activities may alter hydrologic and geomorphic processes.

A1-9

Why impacts would occur: According to page 5-2 of the DEIR, the Project area has the potential to support SSC, which includes the following species: yellow warbler (*Setophaga petechia*), burrowing owl (*Athene cunicularia*), coastal California gnatcatcher (*Polioptila californica californica*), loggerhead shrike (*Lanius ludovicianus*), coastal whiptail (*Aspidoscelis tigris stejnegeri*); southern California legless lizard (*Anniella stebbinsi*); coast horned lizard (*Phrynosoma blainvillii*), and San Diego black-tailed jackrabbit (*Lepus californicus bennettii*).

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

The Project would require ground disturbance and vegetation removal, likely using heavy equipment. These activities create elevated levels of noise, human activity, dust, ground vibrations, and vegetation disturbance. Preconstruction clearance surveys were proposed within the DEIR. However, this measure only minimizes impacts from crushing and burial to species directly within the work area. Likewise, preconstruction clearance surveys may not be done to a level of detail necessary to locate SSC. SSC could be injured or killed due to lack of focus surveys. Impacts on reptiles of SSC are more likely to occur because these are cryptic species that are less mobile during certain times of the day and seek refuge and hide under structures. Further, the DEIR did not provide any mitigation measures to reduce levels of noise, human activity, dust, or ground vibrations to less than significant for SSC in the surrounding area.

Evidence impacts would be significant: A California SSC is a species, subspecies, or distinct population of an animal native to California that currently satisfies one or more of the following (not necessarily mutually exclusive) criteria:

- is extirpated from the State or, in the case of birds, is extirpated in its primary season or breeding role;
- is ESA-listed, but not CESA-listed; meets the State definition of threatened or endangered but has not formally been listed;
- is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for State threatened or endangered status; and/or,
- has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for CESA threatened or endangered status (CDFW 2022b).

A1-9
Continued

CEQA provides protection not only for CESA-listed species, but for any species including but not limited to SSC which can be shown to meet the criteria for State listing. These SSC meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines, § 15380). Therefore, take of SSC could require a mandatory finding of significance (CEQA Guidelines, § 15065). Impacts to any sensitive or special status species should be considered significant under CEQA unless they are clearly mitigated, through appropriate disclosure of the proposed mitigation measures, below a level of significance.

Recommended Potentially Feasible Mitigation Measure(s):

Mitigation Measure #14: Species Surveys – The City should retain a qualified biologist(s) with experience surveying for each of the following species: coastal

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

California gnatcatcher, coastal whiptail, southern California legless lizard, burrowing owl, and coast horned lizard. The qualified biologist(s) should conduct species-specific and season-appropriate surveys where suitable habitat occurs in the Project site. Positive detections of SSC and suitable habitat at the detection location should be mapped. These locations would help to develop more species-specific and location-specific mitigation measures. If SSC are detected, the qualified biologist should use visible flagging to mark the location where SSC was detected.

Burrowing Owl. Surveys for burrowing owl should follow the guidelines outlined in the Staff Report on Burrowing Owl Mitigation (CDFW 2012).

Coastal California gnatcatcher. Surveys for coastal California gnatcatcher should follow the Coastal California Gnatcatcher Presence/Absence Survey Guidelines (USFWS 1997).

California legless lizard, coast horned lizard, and coastal whiptail. CDFW recommends the City conduct focus surveys for California legless lizard, coast horned lizard, and coastal whiptail. Surveys should typically be scheduled during the summer months (June and July) when these animals are most likely to be encountered. To achieve 100 percent visual coverage, CDFW recommends surveys be conducted with parallel transects at approximately 20 feet apart and walked on site in appropriate habitat suitable for each species. Suitable habitat consists of areas of sandy, loose, and moist soils, typically under the sparse vegetation of scrub, chaparral, and within the duff of oak woodlands.

A1-9
Continued

Mitigation Measure #15: Relocation and Avoidance Plan – The City should retain a qualified biologist to prepare a Wildlife Relocation and Avoidance Plan. The Wildlife Relocation and Avoidance Plan should describe all SSC that could occur within the Project site and proper avoidance, handling, and relocation protocols. The Wildlife Relocation Plan should include species-specific avoidance buffers and suitable relocation areas at least 200 feet outside of the Project site. The qualified biologist should submit a copy of a Wildlife Relocation and Avoidance Plan to CDFW for approval prior to any clearing, grading, or excavation work on the Project site.

Mitigation Measure #16: Worker Awareness Training – The City, in consultation with a qualified biologist, should prepare a worker environmental awareness training. The qualified biologist should communicate to workers that upon encounter with an SSC (e.g., during construction or equipment inspections), work must stop, a qualified biologist must be notified, and work may only resume once a qualified biologist has determined that it is safe to do so.

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

Mitigation Measure #17: Biological Monitor – To avoid direct injury and mortality of SSC, the City should have a qualified biologist on site to move out of harm's way wildlife of low mobility that would be injured or killed. Wildlife should be protected, allowed to move away on its own (non-invasive, passive relocation), or relocated to suitable habitat adjacent to the Project site. In areas where a SSC is found, work may only occur in these areas after a qualified biologist has determined it is safe to do so. Even so, the qualified biologist should advise workers to proceed with caution. A qualified biologist should be on site daily during initial ground and habitat disturbing activities as well as vegetation removal. Then, the qualified biologist should be on site weekly or bi-weekly (once every two weeks) for the remainder of the Project phase until the cessation of all ground and habitat disturbing activities, as well as vegetation removal, to ensure that no wildlife is harmed.

Mitigation Measure #18: Scientific Collecting Permit – The City should retain a qualified biologist with appropriate handling permits, or should obtain appropriate handling permits to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with Project construction and activities. CDFW has the authority to issue permits for the take or possession of wildlife, including mammals; birds, nests, and eggs; reptiles, amphibians, fish, plants; and invertebrates (Fish & G. Code, §§ 1002, 1002.5, 1003).

A1-9
Continued

Effective October 1, 2018, a Scientific Collecting Permit is required to monitor Project impacts on wildlife resources, as required by environmental documents, permits, or other legal authorizations; and, to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with otherwise lawful activities (Cal. Code Regs., tit. 14, § 650). Please visit CDFW's Scientific Collection Permits webpage for information (CDFW 2022d). Pursuant to the California Code of Regulations, title 14, section 650, the qualified biologist must obtain or have appropriate handling permits to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with Project construction and activities. An LSA Agreement may provide similar take or possession of species as described in the conditions of the agreement (see Comment #4: Impacts on Streams and Associated Natural Communities).

Mitigation Measure #19: Injured or Dead Wildlife – If any SSC are harmed during relocation or a dead or injured animal is found, work in the immediate area should stop immediately, the qualified biologist should be notified, and dead or injured wildlife documented immediately. A formal report should be sent to CDFW within three calendar days of the incident or finding. The report should include the date, time of the finding or incident (if known), and location of the

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

carcass or injured animal and circumstances of its death or injury (if known). Work in the immediate area may only resume once the proper notifications have been made and additional mitigation measures have been identified to prevent additional injury or death.

Additional Recommendations

Recommendation #6: CDFW recommends the City revise Mitigation Measure MM-BIO-3 for nesting birds in order to mitigate the Project's impact on nesting birds and raptors below a level of significance. CDFW recommends the City incorporate the following underlined language:

> "Construction activities should occur outside of the bird breeding season (generally February 1 to August 31) to the extent practicable. If construction must occur within the bird breeding season, then no more than three days prior to initiation of ground disturbance and/or vegetation removal, a nesting bird preconstruction survey shall be conducted by a qualified biologist within the disturbance footprint plus a 300-foot ~~100-foot~~ buffer (500 feet for raptors)~~, where feasible~~. If the Proposed Project is phased or construction activities stop for more than one week, a subsequent preconstruction nesting bird survey shall be required prior to each phase of construction.
>
> Preconstruction nesting bird surveys shall be conducted during the time of day when birds are active (typically early morning or late afternoon) and shall factor in sufficient time to perform this survey adequately and completely. A report of the nesting bird survey results, if applicable, shall be submitted to the property owner/developer for review and approval prior to ground and/or vegetation disturbance activities.
>
> If nests are found, their locations shall be flagged. An appropriate avoidance buffer for passerines is generally 300 feet and ~~100 feet and up to~~ 500 feet for raptors~~; however, the buffer distance may be modified by a qualified biologist depending upon the species and the proposed work activity~~. The avoidance buffer shall be determined and demarcated by a qualified biologist with bright orange construction fencing or other suitable material that is clearly visible to construction personnel and heavy equipment operators. Active nests shall be monitored periodically by a qualified biologist until it has been determined that the nest is no longer being used by either the young or adults. No ground disturbance shall occur within this buffer until the qualified biologist confirms that the

A1-9
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

breeding/nesting is completed, and all the young have fledged. If no nesting birds are observed during preconstruction surveys, no further actions would be necessary."

Recommendation #7: CDFW recommends the City to provide a complete assessment and impact analysis of the flora and fauna within and adjacent to the off-site improvements associated with the modifications to the Dockweiler Drive Extension Project. Emphasis should be placed upon identifying endangered, threatened, sensitive, regionally, and locally unique species, and sensitive habitats. Impact analysis will aid in determining any direct, indirect, and cumulative biological impacts, as well as specific mitigation or avoidance measures necessary to offset those impacts. The DEIR should include the following information:

a) Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region [CEQA Guidelines, § 15125(c)]. The DPEIR should require individual projects to include measures to fully avoid and otherwise protect sensitive natural communities from Project-related impacts. Project implementation may result in impacts to rare or endangered plants or plant communities that have been recorded adjacent to the Project vicinity. CDFW considers these communities as threatened habitats having both regional and local significance. Plant communities, alliances, and associations with a State-wide ranking of S1, S2, S3 and S4 should be considered sensitive and declining at the local and regional level (CDFW 2023);

A1-9
Continued

b) A thorough, recent, floristic-based assessment of special status plants and natural communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (CDFW 2018);

c) Floristic, alliance- and/or association-based mapping and vegetation impact assessments conducted at future project areas and within the neighboring vicinity. *The Manual of California Vegetation*, second edition, should also be used to inform this mapping and assessment. Adjoining habitat areas should be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions;

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

d) A complete, recent, assessment of the biological resources associated with each habitat type on site and within adjacent areas that could also be affected by individual projects facilitated under the Project;

e) A complete, recent, assessment of rare, threatened, and endangered, and other sensitive species on site and within the area of potential effect, including California Species of Special Concern and California Fully Protected Species (Fish & Game Code, §§ 3511, 4700, 5050 and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare, or threatened species (CEQA Guidelines, § 15380). Seasonal variations in the use of future project areas should also be addressed. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, are required. Acceptable species specific survey procedures should be developed in consultation with CDFW and the USFWS; and

f) A recent wildlife and rare plant survey. CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the individual projects may warrant periodic updated surveys for certain sensitive taxa, particularly if buildout could occur over a protracted time frame, or in phases.

A1-9
Continued

Recommendation #8: CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database (e.g., CNDDB), which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Information on special status species should be submitted to the CNDDB by completing and submitting CNDDB Field Survey Forms (CDFW 2022e). Information on special status native plant populations and sensitive natural communities, the Combined Rapid Assessment and Relevé Form should be completed and submitted to CDFW's Vegetation Classification and Mapping Program (CDFW 2022f).

Recommendation #9: CDFW recommends the City revise update the Project's proposed Biological Resources Mitigation Measures and condition the environmental document to include mitigation measures recommended in this letter. CDFW provides comments to assist the City in developing mitigation measures that are specific, detailed (i.e., responsible party, timing, specific actions, location), enforceable through permit conditions, agreements, or other

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

legally-binding instruments [CEQA Guidelines, § 15126.4(a)(2)], and clear for a measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (CEQA Guidelines, § 15097; Pub. Resources Code, § 21081.6). The City is welcome to coordinate with CDFW to further review and refine the Project's mitigation measures. Per Public Resources Code section 21081.6(a)(1), CDFW has provided the City with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A).

A1-9
Continued

Filing Fees

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required for the underlying Project approval to be operative, vested, and final (Cal. Code Regs., tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

A1-10

Conclusion

We appreciate the opportunity to comment on the Project to assist the City in adequately analyzing and minimizing/mitigating impacts to biological resources. CDFW requests an opportunity to review and comment on any response that the City has to our comments and to receive notification of any forthcoming hearing date(s) for the Project [CEQA Guidelines, § 15073(e)]. If you have any questions or comments regarding this letter, please contact Nicole Leatherman, Environmental Scientist, at (858) 761-8020 or by email at Nicole.Leatherman@wildlife.ca.gov.

A1-11

Sincerely,

Attachment A: Draft Mitigation and Monitoring Reporting Plan

CDFW recommends the following language to be incorporated into the Project's environmental document.

Biological Resources (BIO)			
Mitigation Measure (MM) or Recommendation (REC)		**Timing**	**Responsible Party**
REC-1-Impacts on Crotch's Bumble Bee	The DEIR should provide full disclosure of the presence of Crotch's bumble bee within the Project site. The DEIR should analyze the Project's impact on floral resources, nesting habitat, and overwintering habitat for Crotch's bumble bee. Conclusions made in regard to habitat quality and suitability should be substantiated by scientific and factual data, which may include maps, diagrams, and similar relevant information sufficient to permit full assessment of significant impacts by reviewing agencies. Potential direct and indirect impacts on Crotch's should be discussed in the DEIR. If the Project would impact Crotch's bumble bee and its associated habitat, the DEIR should provide measures to avoid and/or mitigate potential impacts to Crotch's bumble bee and habitat supporting the species.	Prior to finalizing CEQA document	The City
REC-2-Impacts on Mountain Lion	The City should revise the Project's CEQA document in order to provide additional analyses and information on the Project's impact and cumulative effects on mountain lion. The City should discuss the Project's	Prior to finalizing CEQA document	The City

A1-12

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	potential impact on mountain lion from the standpoint of the following impacts: 2. Introducing new/additional barriers to dispersal; 3. Constraining wildlife corridors and pinch points leading to severed migration; 5. Habitat loss, fragmentation, and encroachment; 6. Discuss the number or acreage of landscape linkages/landscape blocks within the Project area and adjacent areas. CDFW recommends referencing CDFW's Natural Landscape Blocks dataset (DS 621). 7. Discuss the acreage of mountain lion habitat suitability (a proxy for mountain lion permeability and use) within the Project area and adjacent areas. CDFW recommends referencing CDFW's Mountain Lion Habitat Suitability dataset (DS 2916) and Mountain Lion Predicted Habitat CWHW dataset (DS 2616). 8. Provide an analysis of current landscape intactness (current level of development) around the Project site, and how the Project may impact habitat connectivity or impede mountain lion movement across the landscape to remaining adjacent habitats. 9. Increased human presence, noise, and lighting; 10. Increased fire risk; and, 11. Use of herbicides, pesticides, and rodenticides. A cumulative impact analysis should evaluate potential impacts on mountain lion from multiple spatial scales		

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	that should include the City of Santa Clarita, San Gabriel Mountains, range of the Central Coast South mountain lion population, and the range of the Southern California/Central Coast Evolutionarily Significant Unit of mountain lion. Impacts should include introducing new/additional barriers to dispersal; constraining wildlife corridors and pinch points leading to severed migration; habitat loss, fragmentation, and encroachment; and increasing human-wildlife interactions and impacts. Direct and indirect effects of a project shall be clearly identified and described, giving due consideration to both the sort-term and long-term effects. "The discussion should include […] physical changes, alteration to the ecological systems, and changes induced in population distribution, population concentration, and the human use of the land (including commercial and residential development), health and safety problems caused by the physical changes […]" [CEQA Guidelines, § 15126.2(a)]. Also, an EIR "shall discuss cumulative impacts of a project." "A cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts" [CEQA Guidelines, §§ 15064(h)(1), 15130].		
REC-3-Mountain Lion Mitigation	The Project's CEQA document should provide mitigation for mountain lion and justify how proposed mitigation would reduce the Project's impact on mountain lion to less than significant. CDFW	Prior to finalizing CEQA document	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	recommends the City recirculate the Project's CEQA document for more meaningful public review and assessment of the City's impact analysis and mitigation measures for mountain lion.		
REC-4-Issuance of Incidental Take Permit	Revisions to the Fish and Game Code, effective January 1998, may require that CDFW issue a separate CEQA document for the issuance of an Incidental Take Permit for the Project unless the Project's CEQA document addresses all the Project's impact on CESA endangered, threatened, and/or candidate species. The Project's CEQA document should also specify a mitigation monitoring and reporting program that will meet the requirements of an Incidental Take Permit. It is important that the take proposed to be authorized by CDFW's Incidental Take Permit be described in detail in the Project's CEQA document. Also, biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for an Incidental Take Permit. However, it is worth noting that mitigation for the Project's impact on a CESA endangered, threatened, and/or candidate species proposed in the Project's CEQA document may not necessarily satisfy mitigation required to obtain an Incidental Take Permit.	Prior to finalizing CEQA document	The City
REC-5-CEQA document and CDFW's issuance of an LSA agreement	CDFW's issuance of an LSA Agreement for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the CEQA document from the lead agency/Project applicant for the Project. To minimize additional requirements by CDFW pursuant to Fish and Game Code section 1600 et	Prior to finalizing CEQA document	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	seq. and/or under CEQA, a Project's CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of an LSA Agreement. To compensate for any on- and off-site impacts to aquatic and riparian resources, additional mitigation conditioned in any LSA Agreement may include the following: erosion and pollution control measures; avoidance of resources; protective measures for downstream resources; on- and/or off-site habitat creation; enhancement or restoration; and/or protection and management of mitigation lands in perpetuity.		
REC-6-Impacts to Nesting Birds	CDFW recommends the City revise Mitigation Measure MM-BIO-3 for nesting birds per the language in the comment letter.	Prior to finalizing CEQA document	The City
REC-7-Baseline Biological Assessment and Impact Analysis	CDFW recommends the City to provide a complete assessment and impact analysis of the flora and fauna within and adjacent to the off-site improvements associated with the modifications to the Dockweiler Drive Extension Project. Emphasis shall be placed upon identifying endangered, threatened, sensitive, regionally, and locally unique species, and sensitive habitats. Impact analysis will aid in determining any direct, indirect, and cumulative biological impacts, as well as specific mitigation or avoidance measures necessary to offset those impacts. The DEIR should include the following information:	Prior to finalizing CEQA document	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	a) Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region [CEQA Guidelines, § 15125(c)]. The DPEIR should require individual projects to include measures to fully avoid and otherwise protect sensitive natural communities from Project-related impacts. Project implementation may result in impacts to rare or endangered plants or plant communities that have been recorded adjacent to the Project vicinity. CDFW considers these communities as threatened habitats having both regional and local significance. Plant communities, alliances, and associations with a State-wide ranking of S1, S2, S3 and S4 should be considered sensitive and declining at the local and regional level (CDFW 2023); b) A thorough, recent, floristic-based assessment of special status plants and natural communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (CDFW 2018); c) Floristic, alliance- and/or association-based mapping and vegetation impact assessments conducted at future project areas and within the neighboring vicinity. *The Manual of California Vegetation*, second edition, should also be used		

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	to inform this mapping and assessment. Adjoining habitat areas should be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions; d) A complete, recent, assessment of the biological resources associated with each habitat type on site and within adjacent areas that could also be affected by individual projects facilitated under the Project; e) A complete, recent, assessment of rare, threatened, and endangered, and other sensitive species on site and within the area of potential effect, including California Species of Special Concern and California Fully Protected Species (Fish & Game Code, §§ 3511, 4700, 5050 and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare, or threatened species (CEQA Guidelines, § 15380). Seasonal variations in the use of future project areas should also be addressed. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, are required. Acceptable species specific survey procedures should be developed in consultation with CDFW and the USFWS; and		

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	f) A recent wildlife and rare plant survey. CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the individual projects may warrant periodic updated surveys for certain sensitive taxa, particularly if buildout could occur over a protracted time frame, or in phases.		
REC-8- Submitting Data to CNDDB	CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database (e.g., CNDDB) which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Information on special status species should be submitted to the CNDDB by completing and submitting CNDDB Field Survey Forms (CDFW 2022e). Information on special status native plant populations and sensitive natural communities, the Combined Rapid Assessment and Relevé Form should be completed and submitted to CDFW's Vegetation Classification and Mapping Program (CDFW 2022f).	Prior to finalizing CEQA document	The City
REC-9- Mitigation and Monitoring Reporting Program	CDFW recommends the City revise update the Project's proposed Biological Resources Mitigation Measures and condition the environmental document to include mitigation measures recommended in this letter. CDFW provides comments to assist the City in developing mitigation measures that are specific, detailed (i.e.,	Prior to finalizing CEQA document	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	responsible party, timing, specific actions, location), enforceable through permit conditions, agreements, or other legally-binding instruments [CEQA Guidelines, § 15126.4(a)(2)], and clear for a measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (CEQA Guidelines, § 15097; Pub. Resources Code, § 21081.6). The City is welcome to coordinate with CDFW to further review and refine the Project's mitigation measures. Per Public Resources Code section 21081.6(a)(1), CDFW has provided the City with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A).		
MM-1-Impacts on Crotch's Bumble Bee – Surveys	If the Project site has suitable foraging or nesting habitat for Crotch's bumble bee, the City should retain a qualified entomologist with the appropriate take authorization to conduct surveys to determine presence/absence. Surveys should be conducted within one year prior to vegetation removal and/or grading throughout the entire Project site by a qualified entomologist familiar with the species' behavior and life history. A minimum of three surveys should also be conducted during peak flying season when the species is most likely to be detected above ground, between March 1 to September 1 (Thorp et al. 1983). The qualified entomologist should utilize a non-lethal survey methodology and obtain appropriate photo vouchers for species confirmation (CBBA 2023). During the surveys, the entomologist should flag inactive small	Prior to any ground-disturbing activities and vegetation removal	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	mammal burrows and other potential nest sites to reduce the risk of take. Survey results, including negative findings, should be submitted to CDFW prior to obtaining appropriate permits. At minimum, a survey report should provide the following: a) A description and map of the survey area, focusing on areas that could provide suitable habitat for Crotch's bumble bee. CDFW recommends the map show surveyor(s) track lines to document that the entire site was covered during field surveys. b) Field survey conditions that should include name(s) of qualified entomologist(s) and brief qualifications; date and time of survey; survey duration; general weather conditions; survey goals; and species searched. c) Map(s) showing the location of nests/colonies. d) A description of physical (e.g., soil, moisture, slope) and biological (e.g., plant composition) conditions where each nest/colony is found. A sufficient description of biological conditions, primarily impacted habitat, should include native plant composition (e.g., density, cover, and abundance) within impacted habitat (e.g., species list separated by vegetation class, density, cover, and abundance of each species).		
MM-2-Impacts on Crotch's	If Crotch's bumble bee is detected, the qualified entomologist should identify the location of all nests within and adjacent to the Project site. A 15-meter no	Prior to any and during ground-	The City

A1-12

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

Bumble Bee – Entomologist	disturbance buffer zone should be established around any identified nest(s) to reduce the risk of disturbance or accidental take. A qualified entomologist should expand the buffer zone as necessary to prevent disturbance or take.	disturbing activities and vegetation removal	
MM-3-Impacts on Crotch's Bumble Bee – Take authorization	If Crotch's bumble bee is detected and impacts to Crotch's bumble bee cannot be feasibly avoided, the City should consult with CDFW and obtain appropriate take authorization from CDFW (pursuant to Fish & Game Code, § 2080 et seq). Appropriate authorization from CDFW under CESA may include an Incidental Take Permit (ITP) or a Consistency Determination in certain circumstances, among other options [Fish & Game Code, §§ 2080.1, 2081, subds. (b) and (c)]. Early consultation is encouraged, as significant modification to the Project and mitigation measures may be required to obtain an ITP. Revisions to the Fish and Game Code, effective January 1998, may require that CDFW issue a separate CEQA document for the issuance of an ITP for the Project unless the Project's CEQA document addresses all the Project's impact on CESA endangered, threatened, and/or candidate species. The Project's CEQA document should also specify a mitigation monitoring and reporting program that will meet the requirements of an ITP. It is important that the take proposed to be authorized by CDFW's ITP be described in detail in the Project's CEQA document. Also, biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for an ITP. However, it is worth noting that mitigation for the Project's impact on a	Prior to any ground-disturbing activities and vegetation removal	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

	CESA endangered, threatened, and/or candidate species proposed in the Project's CEQA document may not necessarily satisfy mitigation required to obtain an ITP.		
MM-4- Impacts on Crotch's Bumble Bee – Replacement Resources	Any floral resource associated with Crotch's bumble bee that will be removed or damaged by the Project should be replaced at no less than 1:1. Floral resources should be replaced as close to their original location as is feasible. If active Crotch's bumble bee nests have been identified and floral resources cannot be replaced within 200 meters of their original location, floral resources should be planted in the most centrally available location relative to identified nests. This location should be no more than 1.5 kilometers from any identified nest. Replaced floral resources may be split into multiple patches to meet distance requirements for multiple nests. These floral resources should be maintained in perpetuity and should be replanted and managed as needed to ensure the habitat is preserved.	Prior to any ground-disturbing activities and vegetation removal	The City
MM-5- Incidental Take Permit for Mountain Lion	If take or adverse impacts to mountain lion cannot be avoided, the City should consult with CDFW and obtain appropriate take authorization from CDFW (pursuant to Fish & Game Code, § 2080 *et seq.*). The City should comply with the mitigation measures detailed in the take authorization issued by CDFW. The City should provide a copy of a fully executed take authorization prior to the City issuing the Project grading permits and related building permits.	Prior to the issuance of grading permits.	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

MM-6-Prohibit Use of Rodenticides	The City should prohibit use of any rodenticides and second-generation anticoagulant rodenticides on the property in perpetuity. The City should provide documentation and a plan that rodenticides and second-generation anticoagulant rodenticides will be prohibited.	Prior to the issuance of grading permits.	The City
MM-7-Trash Receptacles	The City should place all community trash receptacles in areas that would not create an unnatural food source that may attract nuisance wildlife and to minimize waste and pollution in natural areas and open space.		The City
MM-5-Impacts on CAGN – Protocol Surveys	CDFW recommends the continued survey for coastal California gnatcatcher to determine presence/absence within or adjacent to suitable or designated critical habitat in the Project site. The City should retain a qualified biologist with an appropriate USFWS permit to survey the Project site. The qualified biologist should conduct surveys according to USFWS Coastal California Gnatcatcher (Polioptila californica californica) Presence/Absence Survey Guidelines (USFWS 1997). The survey protocol requires a minimum of six surveys to be conducted at least one week apart from March 15 through June 30 and a minimum of nine surveys at least two weeks apart from July 1 through March 14. The protocol should be followed for all surveys unless otherwise authorized by the USFWS in writing. CDFW recommends gnatcatcher surveys be conducted and USFWS notified (per protocol guidance) prior to issuance of a grading permit.	Prior to any ground-disturbing activities and vegetation removal	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

MM-6-Impacts on CAGN – Take Permit	If coastal California gnatcatcher is present, the City should consult with the USFWS to determine if the Project would result in take of coastal California gnatcatcher. Consultation with the USFWS, in order to comply with the ESA, is advised well in advance of any ground-disturbing activities and/or vegetation removal that may impact gnatcatcher. If a take permit from the USFWS is needed, the City should comply with the mitigation measures detailed in a take permit issued from USFWS.	Prior to any ground-disturbing activities and vegetation removal	The City
MM-7-Impacts on CAGN – Replacement Habitat	If the Project would result in permanent loss of habitat, the City should provide replacement habitat at no less than 2:1 for the total acreage of habitat that is impacted. Replacement habitat should be protected in perpetuity under a conservation easement dedicated to a local land conservancy or other appropriate entity that has been approved to hold and manage mitigation lands. An appropriate non-wasting endowment should be provided for the long-term management of mitigation lands. A conservation easement and endowment funds should be fully acquired, established, transferred, or otherwise executed by the City prior to any ground-disturbing activities or vegetation removal.	Prior to any ground-disturbing activities and vegetation removal	The City
MM-8-Lake and Streambed Alteration	The City should notify CDFW pursuant to Fish and Game Code section 1602 for construction and activities occurring near or impacting streams and associated natural communities. The City should notify CDFW prior	Prior to any ground-disturbing activities	The City

A1-12
Continued

DocuSign Envelope ID: D7400486-2300-4E5E-8DD6-78E7974EA537

Notification – Streambeds	to any ground-disturbing activities and vegetation removal, including staging, near streams. The notification to CDFW should provide the following information: 1) A stream delineation in accordance with the U.S. Fish and Wildlife Service wetland definition adopted by CDFW[3] (Cowardin et al. 1979); 2) Linear feet and/or acreage of streams and associated natural communities that would be permanently and/or temporarily impacted by the Project. This includes impacts as a result of routine maintenance and fuel modification. Plant community names should be provided based on vegetation association and/or alliance per the Manual of California Vegetation; 3) A discussion as to whether impacts on streams within the Project site would impact those streams immediately outside of the Project site where there is hydrologic connectivity. Potential impacts such as changes to drainage pattern, runoff, and sedimentation should be discussed; and, 4) A hydrological evaluation of the 100-year storm event to provide information on how water and sediment is conveyed through the Project site. Additionally, the hydrological evaluation should assess a sufficient range of storm events (e.g., 100, 50, 25, 10, 5, and 2-year frequency storm events) to evaluate water and sediment transport under	and vegetation removal	

A1-12
Continued

[3] Be advised that some wetland and riparian habitats subject to CDFW's authority may extend beyond the jurisdictional limits of the U.S. Army Corps of Engineers' Section 404 permit and Regional Water Quality Control Board Section 401 Certification.

	pre-Project and post-Project conditions.		
MM-9-Lake and Streambed Alteration Agreement - Streambeds	If the Project would impact streams and associated natural communities, the City should obtain an LSA Agreement prior to any ground-disturbing activities and vegetation removal, including staging, near streams.	Prior to any ground-disturbing activities and vegetation removal	The City
MM-10-Compensatory Mitigation – Streambeds	The City should provide compensatory mitigation at no less than 3:1 for impacts to streams and associated natural communities, or at a ratio acceptable to CDFW per an LSA Agreement.	Prior to any ground-disturbing activities and vegetation removal	The City
MM-11-SSC Surveys	The City should retain a qualified biologist(s) with experience surveying for each of the following species: coastal California gnatcatcher, coastal whiptail, southern California legless lizard, burrowing owl, and San Diego black-tailed jackrabbit. The qualified biologist(s) should conduct species-specific and season appropriate surveys where suitable habitat occurs in the Project site. Positive detections of SSC and suitable habitat at the detection location should be mapped. These locations would help to develop more species-specific and location-specific mitigation measures. If SSC are detected, the qualified biologist should use visible flagging to mark the location where SSC was detected.	Prior to any ground-disturbing activities and vegetation removal	The City

	Burrowing Owl. Surveys for burrowing owl should follow the guidelines outlined in the Staff Report on Burrowing Owl Mitigation (CDFW 2012). Coastal California gnatcatcher. Surveys for coastal California gnatcatcher should follow the Coastal California Gnatcatcher Presence/Absence Survey Guidelines (USFWS 1997). California legless lizard and coastal whiptail. CDFW recommends the City conduct focus surveys for California legless lizard and coastal whiptail. Surveys should typically be scheduled during the summer months (June and July) when these animals are most likely to be encountered. To achieve 100 percent visual coverage, CDFW recommends surveys be conducted with parallel transects at approximately 20 feet apart and walked on site in appropriate habitat suitable for each species. Suitable habitat consists of areas of sandy, loose, and moist soils, typically under the sparse vegetation of scrub, chaparral, and within the duff of oak woodlands.		
MM-12-Relocation and Avoidance Plan	The City should retain a qualified biologist to prepare a Wildlife Relocation and Avoidance Plan. The Wildlife Relocation and Avoidance Plan should describe all SSC that could occur within the Project site and proper avoidance, handling, and relocation protocols. The Wildlife Relocation Plan should include species-specific avoidance buffers and suitable relocation areas at least 200 feet outside of the Project site. The qualified	Prior to any ground-disturbing activities and vegetation removal	The City

A1-12

	biologist should submit a copy of a Wildlife Relocation and Avoidance Plan to CDFW for approval prior to any clearing, grading, or excavation work on the Project site.		
MM-13-WEAP	The City, in consultation with a qualified biologist, should prepare a worker environmental awareness training. The qualified biologist should communicate to workers that upon encounter with an SSC (e.g., during construction or equipment inspections), work must stop, a qualified biologist must be notified, and work may only resume once a qualified biologist has determined that it is safe to do so	Prior to any ground-disturbing activities and vegetation removal	The City
MM-14-Biological Monitor	To avoid direct injury and mortality of SSC, the City should have a qualified biologist on site to move out of harm's way wildlife of low mobility that would be injured or killed. Wildlife should be protected, allowed to move away on its own (non-invasive, passive relocation), or relocated to suitable habitat adjacent to the Project site. In areas where a SSC is found, work may only occur in these areas after a qualified biologist has determined it is safe to do so. Even so, the qualified biologist should advise workers to proceed with caution. A qualified biologist should be on site daily during initial ground and habitat disturbing activities as well as vegetation removal. Then, the qualified biologist should be on site weekly or bi-weekly (once every two weeks) for the remainder of the Project phase until the cessation of all ground and habitat disturbing activities, as well as vegetation removal, to ensure that no wildlife is harmed.	During ground-disturbing activities and vegetation removal	The City

MM-15-Scientific Collecting Permit	The City should retain a qualified biologist with appropriate handling permits, or should obtain appropriate handling permits to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with Project construction and activities. CDFW has the authority to issue permits for the take or possession of wildlife, including mammals; birds, nests, and eggs; reptiles, amphibians, fish, plants; and invertebrates (Fish & G. Code, §§ 1002, 1002.5, 1003). Effective October 1, 2018, a Scientific Collecting Permit is required to monitor Project impacts on wildlife resources, as required by environmental documents, permits, or other legal authorizations; and, to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with otherwise lawful activities (Cal. Code Regs., tit. 14, § 650). Please visit CDFW's Scientific Collection Permits webpage for information (CDFW 2022d). Pursuant to the California Code of Regulations, title 14, section 650, the qualified biologist must obtain or have appropriate handling permits to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with Project construction and activities. An LSA Agreement may provide similar take or possession of species as described in the conditions of the agreement (see Comment #4: Impacts on Streams and Associated Natural Communities).	Prior to any ground-disturbing activities and vegetation removal	The City
MM-16-Injured or Dead Wildlife	If any SSC are harmed during relocation or a dead or injured animal is found, work in the immediate area should stop immediately, the qualified biologist should	During ground-disturbing	The City

Letter No. A1
Erinn Wilson-Olgin, Environmental Program Manager I
South Coast Region
California Department of Fish and Wildlife
3883 Ruffin Road
San Diego, CA 92123

Response to Comment No. A1-1

This introductory comment acknowledges receipt of the Draft EIR for the Project and introduces specific comments from the California Department of Fish and Wildlife (CDFW). The comment also identifies the statutory responsibilities of CDFW as California's Trustee Agency for fish and wildlife resources under CEQA. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A1-2

The comment identifies the statutory responsibilities of CDFW as a Responsible Agency under CEQA. In addition, CDFW recommends that the Project applicant obtain appropriate authorization under the California Fish and Game Code. As noted on page 2.0-25 of the Draft EIR, a Streambed Alteration Agreement from the CDFW is anticipated to be necessary for the Project. However, as described on pages 4.3-17 and 4.3-18 of the Draft EIR, a "take" permit pursuant to the California Endangered Species Act is not anticipated to be required since no threatened or endangered species are expected to exist on-site. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A1-3

The comment summarizes the Project Description but does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A1-4

The comment is an introductory statement to specific comments on the analysis of biological resources presented in the Draft EIR. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A1-5

The comment states the Project may impact suitable habitat and floral resources for Crotch's bumble bee (*Bombus crotchii*), a candidate species for listing under the California Endangered Species Act and states that the Draft EIR does not provide mitigation measures to reduce the potential impact to Crotch's bumble bee.

The candidacy status of Crotch's bumble bee was reinstated by the California Fish and Game Commission on September 30, 2022. The literature review for the Biological Resources Assessment report was conducted on January 18, 2022, when Crotch's bumble bee was not a candidate to be considered a special status species. The Notice of Preparation (NOP) for the Draft EIR was published on March 29, 2022, and the baseline conditions for biological resources were established at that time (per CEQA Guidelines Section 15125). While the majority of the Project Site is disturbed or vegetated with non-native grasslands with few floral resources, the

City acknowledges that upland scrub habitats within the Project Site might arguably provide potentially suitable nesting and foraging habitat for Crotch's bumble bee. Accordingly, the Draft EIR was revised to discuss the potential for the species to occur, evaluate potential project impacts, and provide species-specific avoidance and minimization measures in accordance with the comment's recommendation. Specifically, Mitigation Measure MM-BIO-6 requiring presence/ absence surveys conducted by a qualified biologist was added. If Crotch's bumble bee is detected and cannot be feasibly avoided, the Applicant is required to seek an Incidental Take Permit from CDFW. Mitigation Measures MM-BIO-7, MM-BIO-8, and MM-BIO-9 would require the application for such take authorization, establishment of a buffer zone around any active nest, and replacement of any floral resource associated with Crotch's bumble bee that is removed or damaged. If Crotch's bumblebee is present within the Project Site, implementation of Mitigation Measures MM-BIO-7 through MM-BIO-9 would reduce potential impacts to the species to a less-than-significant level.

The following revisions were made to Section 4.3, Biological Resources of the Draft EIR:

- The following was added after the first paragraph on page 4.3-5 (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  Crotch's bumble bee (*Bombus crotchii*) (a candidate CESA-listed species) inhabits open grassland or scrub habitats from coastal California east to the Sierra-Cascade crest and south into Mexico. The species nests primarily in abandoned small mammal burrows but may also nest under perennial bunch grasses or thatched annual grasses, underbrush piles, in old bird nests, and in dead trees or hollow logs.[2] Overwintering sites utilized by Crotch's bumble bee mated queens include soft, disturbed soil, or under leaf litter or other debris.[3] Ten CNDDB records of Crotch's bumble bee are documented within the regional vicinity of the Project Site including five records between 2017-2020, the closest of which is approximately 2.5 miles to the southwest. While the majority of the Project Site is disturbed or vegetated with non-native grasslands with few floral resources, upland scrub communities within the Project Site provide suitable overwintering and foraging habitat for the species, and the species has a potential to occur.

Colla, Bumble Bees of North America: An Identification Guide, 2014, p. 208; Hatfield, R., Jepsen, S., Foltz Jordan, S., Blackburn, M., Code, Aimee, A Petition to the State of California Fish and Game Commission to List Four Species of Bumblebees as Endangered Species, 2018.

  [3] Goulson, D., Bumblebees: Behavior, Ecology, and Conservation, 2010, p. 317.

- The following was added after the third paragraph on page 4.3-18 (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  If Crotch's bumble bee is present during Project construction, ground disturbance and vegetation removal from the Project Site during the breeding season could result in the incidental loss of breeding success or otherwise lead to nest abandonment in areas within and adjacent to the Project Site. In addition to potential habitat loss, human disturbance, heavy machinery, and construction activities could potentially result in direct mortality to Crotch's bumble bee adults, eggs, or larvae. These impacts would be potentially significant.

- The following was added after the last paragraph on page 4.3-19 (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

MM-BIO-6: The Permittee must retain a qualified biologist with the appropriate take authorization (if such authorizations are available to biologist at the time of survey) to conduct surveys to determine presence/absence. A survey must be conducted at least one year before the City issues a grading permit. The survey must review the entire Project Site by a qualified biologist familiar with the species' behavior and life history. A minimum of three surveys must also be conducted during peak flying season when the species is most likely to be detected above ground, between March 1 to September 1.[11] The qualified biologist must utilize a non-lethal survey methodology and obtain appropriate photo vouchers for species confirmation.[12] During the surveys, the biologist must identify inactive small mammal burrows and other potential nest sites with visible flags to reduce the risk of take. Survey results, including negative findings, must be submitted to CDFW applying for appropriate permits. At a minimum, a survey report provide the following:

a) A description and map of the survey area, focusing on areas that could provide suitable habitat for Crotch's bumble bee. The map must show surveyor(s) track lines to document that the entire site was covered during field surveys.

b) Field survey conditions that include name(s) of qualified biologist(s) and brief qualifications, date and time of survey, survey duration, general weather conditions, survey goals, and species searched.

c) Map(s) showing the location of nests/colonies.

d) A description of physical (e.g., soil, moisture, slope) and biological (e.g., plant composition) conditions where each nest/colony, if any, is found. A sufficient description of biological conditions, primarily impacted habitat, must include native plant composition (e.g., density, cover, and abundance) within impacted habitat (e.g., species list separated by vegetation class, density, cover, and abundance of each species).

[11] Robbin W. Thorp, Donald S. Horning Jr., and Lorry L. Dunning, Bumble Bees and Cuckoo Bumble Bees of California, Bulletin of the California Insect Survey 23, 1983.

[12] California Bumble Bee Atlas, Photography Tips and Bee Processing Workflow, https://www.cabumblebeeatlas.org/photography-tips.html, accessed June 7, 2023.

MM-BIO-7: If Crotch's bumble bees are detected, the qualified biologist must identify the location of any nests within and adjacent to the Project Site. A 15-meter no disturbance buffer zone must be established

around any identified active nest(s) to reduce the risk of disturbance or accidental take. A qualified biologist may expand the buffer zone as necessary to prevent disturbance or take.

MM-BIO-8: If Crotch's bumble bee is detected and impacts to Crotch's bumble bee cannot be feasibly avoided, the Permittee must consult with CDFW and obtain appropriate take authorization from CDFW (pursuant to California Fish and Game Code Section 2080, *et seq*). Appropriate authorization from CDFW under the California Endangered Species Act (CESA) may include an Incidental Take Permit (ITP) or a Consistency Determination in certain circumstances, among other options (California Fish and Game Code Sections 2080.1, 2081). Early consultation is encouraged, as significant modification to the Project and mitigation techniques may be required to obtain an ITP. The California Fish and Game Code may require that CDFW issue a separate CEQA document before issuing an ITP for the Project unless the Project's CEQA document addresses all Project impacts on CESA endangered, threatened, and/or candidate species.

MM-BIO-9: Any floral resource associated with Crotch's bumble bee that will be removed or damaged by the Project must be replaced at not less than 1:1. Floral resources must be replaced as close to their original location as feasible. If active Crotch's bumble bee nests are identified and floral resources cannot be replaced within 200 meters of their original location, floral resources must be planted in the most centrally available location relative to identified nests. This location should be not more than 1.5 kilometers from any identified nest. Replaced floral resources may be split into multiple patches to meet distance requirements for multiple nests. These floral resources must be maintained in perpetuity and be replanted and managed as needed to ensure the habitat is preserved.

- The first paragraph on page 4.3-20 was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  Implementation of **Mitigation Measures MM-BIO-1** through **MM-BIO-3** and **MM-BIO-6** through **MM-BIO-9** would reduce the potential to impact candidate, sensitive, or special-status species, including Crotch's bumble bee, southern California rufous-crowned sparrow, Cooper's hawk, and yellow warbler, as well as other native birds protected under the MBTA and CFGC, to a less-than-significant level.

Response to Comment No. A1-6

The comment states the Project may impact suitable habitat for mountain lion (*Puma concolor*), a candidate species for listing under the CESA, by development of habitat, restricting wildlife movement corridors, and increasing human presence and associated traffic, noise, and lighting.

The comment also indicates that the Draft EIR does not provide mitigation measures to reduce the potential impact to mountain lion.

The Draft EIR was revised to discuss the potential for the species to occur and evaluate potential Project and cumulative impacts. The Project Site is within the range of the Southern California/Central Coast Evolutionary Significant Unit of mountain lion, and scrub vegetation communities within the Project Site provide moderately suitable foraging habitat for the species.[1] However, the likelihood for mountain lion to be present within the Project Site is low due to a variety of factors: the Project Site is not within a natural landscape block; the nearest blocks are within the Santa Susana Mountains southwest of I-5 and the San Gabriel Mountains east of SR-14.[2] The CDFW mountain lion habitat suitability dataset predicts relatively low probability of use within the Project Site, similar to the urban center of Santa Clarita.[3] The Project Site is bounded to the southwest and southeast by commercial development, and to the east by residential development. While Placerita Creek may provide local movement pathways for mobile species, such as mule deer and coyote, on a broader landscape scale, Placerita Creek and its surrounding open spaces (including Quigley Canyon Open Space) are cut off from suitable mountain lion habitat linkages and corridors by SR-14, approximately 2 miles to the east. A review of iNaturalist shows that mountain lions or their sign (e.g., scat, tracks) were not documented within the Santa Clarita Valley in the area bounded by I-5, SR-14, and the Santa Clara River. Newhall Creek, situated downstream of the Project Site, is heavily constrained on both sides by intensive residential and commercial development. Accordingly, the potential for mountain lion occurrence is low, and Placerita Creek is not likely to function as regional movement pathway for mountain lions, which require extensive home ranges. Due to the extensive development surrounding the Project Site discussed above, human presence from the surrounding land uses is already at a high level, and development of the Project would not represent a significant change in this condition. Additionally, the Project would maintain Placerita Creek as a natural bottom drainage course and, thus, would not introduce new barriers within Placerita Creek that would impede mountain lion movement or dispersal, or constrain wildlife corridors and pinch points leading to severed migration. Accordingly, the Project would not result in adverse impacts to mountain lion, and take permitting would not be necessary. The Project would comply with all applicable herbicide and rodenticide regulations. As a result, additional mitigation measures prohibiting rodenticide use on the property in perpetuity are not necessary to reduce Project impacts to a less-than-significant level.

The following revisions were made to Section 4.3, Biological Resources, of the Draft EIR:

- The following was added after the second paragraph on page 4.3-6 (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  Mountain Lion

  The Project Site is within the range of the Southern California/Central Coast Evolutionary Significant Unit of mountain lion (*Puma concolor*) (a candidate CESA-

Response to Comment No. A1-7

The comment states that the Project could result in temporary or permanent impacts to coastal California gnatcatcher through alteration or loss of suitable nesting or foraging habitat, and that Project activities occurring during the breeding and nesting season could also result in the incidental loss of fertile eggs or nestlings. The comment recommends additional protocol-level presence/absence surveys be conducted prior to issuance of a grading permit.

Protocol surveys were completed by a qualified biologist with over 20 years of experience and an active U.S. Fish and Wildlife Service (USFWS) permit in compliance with USFWS Section 10(a) of the Federal Endangered Species Act (FESA), Special Terms and Conditions for Endangered

and Threatened Wildlife Species Permit. The survey included six breeding season surveys in accordance with the USFWS current Coastal California Gnatcatcher Presence/Absence Survey Protocol, including notification to USFWS. According to the USFWS, the protocol for the breeding season was designed to provide a 95-percent confidence level of detecting coastal California gnatcatchers at a site when they are present. The accepted standard for protocol presence/ absence surveys for coastal California gnatcatcher is either six breeding season surveys or nine non-breeding season surveys; USFWS does not require completion of both breeding and non-breeding season surveys for the results to be considered valid. Furthermore, the potential habitat on the Project Site for supporting coastal California gnatcatcher is of marginal quality. Moreover, the site is generally surrounded by existing development; it is relatively fragmented from suitable habitat for coastal California gnatcatcher. Accordingly, continued surveys for the species are not necessary to determine presence/absence of the species. The removal or alteration of unoccupied habitat of marginal quality for the species within the Project Site would not result in adverse effects for the species, and compensatory mitigation is not warranted.

Response to Comment No. A1-8

The comment states the Project would result in permanent and/or temporary loss of streams and associated natural communities. The comment also states that the Project's impact on streams and associated natural communities has yet to be mitigated below a level of significance as the Project does not recommend the avoidance of impacts to streams or propose a setback distance from the streams on-site. In addition, the comment claims that the construction of a bridge with piers within the streambed, and the installation of undescribed streambank stabilization measures are not sufficiently analyzed in order to fully understand whether these activities may be considered a substantial impact on streams and associated natural communities. According to the comment, the proposed mitigation ratio of 1:1 may be insufficient to mitigate for impacts to streams and natural communities. Moreover, the comment also states that the Draft EIR does not provide a jurisdictional delineation or impact analysis for the modifications proposed to the Dockweiler Drive Extension Project, which includes the installation of a pedestrian and bike bridge from the Jan Heidt Newhall Metrolink Station on Railroad Avenue to the future extension of Dockweiler Drive.

As discussed on page 4.3-22 in Section 4.3, Biological Resources, of the Draft EIR, Project impacts to streams and associated riparian habitat would be potentially significant but would be mitigated to a less-than-significant level with implementation of Mitigation Measure MM-BIO-5 (Jurisdictional Waters and Wetlands). Avoidance of the unnamed ephemeral drainages would greatly restrict the available area for Project development and is not feasible for the reasonable development of the Project Site. However, the Project largely avoids and preserves in place the segment of Placerita Creek that traverses the Project Site. The Project would result in temporary and permanent impacts to Placerita Creek, but these impacts are the minimum necessary to allow for bridge construction and necessary flood control and bank protection improvements. Following Project construction, Placerita Creek would be preserved as open space within the Project Site. The design of the Placerita Creek channel generally maintains the existing scour and deposition characteristics and the placement of piers for the bridge have been evaluated in the *Hydraulic and Sediment Transport Analyses for Blackhall Studios*[4] (Hydraulic Report), prepared by Chang Consultants, dated January 19, 2022 (Appendix I-4 of the Draft EIR). As noted below, Mitigation

[4] Chang Consultants, Wayne W. Chang, MS, PE 46548, Hydraulic and Sediment Transport Analyses for Blackhall Studios, Draft Report, January 19, 2022 (Final Report June 5, 2023).

Measure MM-BIO-1 was clarified to state that access routes, staging, and construction areas are limited to the minimum area necessary to achieve the Project goal and minimize impacts to jurisdictional resources and sensitive natural communities, including locating access routes and ancillary construction areas outside of these areas. Although City agrees that 1:1 mitigation is low, the ephemeral drainages have very low habitat quality and a lower compensatory mitigation ratio may be appropriate if determined to be acceptable to the applicable regulatory agencies (including CDFW, the commenter) during the permitting process. The City agrees that typical mitigation is likely to be closer to 3:1 but would be subject to detailed analysis and permitting on a case-by-case basis. CEQA mitigation measures are not necessary to require notification of CDFW for construction and activities occurring near or impacting streams and associated natural communities and any corresponding Lake or Streambed Alteration (LSA) Agreement, as recommended by the comment, are not necessary as such notification and LSA Agreement are required by California Fish and Game Code Section 1602. While portions of the extension of Dockweiler Drive would be conducted in conjunction with the Project, these elements were evaluated previously for the Lyons Avenue/Dockweiler Drive Extension Project (SCH 2013082016), and jurisdictional resources were determined not to be present.

The following revisions and additions were made to Mitigation Measure MM-BIO-1 on page 4.3-19 of Section 4.3, Biological Resources, of the Draft EIR (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

MM-BIO-1: The Project shall implement the following best management practices (BMPs) during construction:

- The contractor shall clearly delineate the construction limits and prohibit any construction-related traffic outside those boundaries;
- Project-related vehicles shall observe a 10-mile-per-hour speed limit within the unpaved limits of construction;
- All open trenches or excavations shall be fenced and/or sloped to prevent entrapment of wildlife species;
- All food-related trash items such as wrappers, cans, bottles, and food scraps generated during Project construction shall be disposed of in closed containers only and removed daily from the Project Site;
- No deliberate feeding of wildlife shall be allowed;
- No pets shall be allowed on the Project Site;
- No firearms shall be allowed on the Project Site;
- If vehicle or equipment maintenance is necessary, it shall be performed In the designated staging areas;
- If construction must occur at night (between dusk and dawn), all lighting shall be shielded and directed downward to minimize

the potential for glare or spillover onto adjacent properties and to reduce impacts on local wildlife; ~~and~~

- During construction, heavy equipment shall be operated in accordance with standard BMPs. All equipment used on-site shall be properly maintained to avoid leaks of oil, fuel, or residues. Provisions shall be in place to remediate any accidental spills;~~.~~

- Access routes, staging, and construction areas shall be limited to the minimum area necessary to achieve the Project goal and minimize impacts to jurisdictional resources and sensitive natural communities, including locating access routes and ancillary construction areas outside of these areas;

- To the satisfaction of the City, the Applicant shall retain a qualified biologist to prepare a Wildlife Relocation and Avoidance Plan. The Wildlife Relocation and Avoidance Plan shall describe all species of special concern (SSC) that could occur within the Project Site and proper avoidance, handling, and relocation protocols. The Wildlife Relocation Plan should include species-specific avoidance buffers and suitable relocation areas at least 200 feet outside of the Project Site. The qualified biologist should submit a copy of a Wildlife Relocation and Avoidance Plan to CDFW for approval prior to any clearing, grading, or excavation work on the Project Site;

- To the satisfaction of the City, the Applicant shall retain a qualified biologist to conduct worker environmental awareness training. The qualified biologist shall communicate to workers that upon encounter with an SSC (e.g., during construction or equipment inspections), work must stop, a qualified biologist must be notified, and work may only resume once a qualified biologist has determined that it is safe to do so; and

- To avoid direct injury and mortality of SSC, the Applicant shall have a qualified biologist on-site to relocate wildlife of low mobility that may be injured or killed because of development. Wildlife should be protected, allowed to move away on its own (non-invasive, passive relocation), or relocated to suitable habitat adjacent to the Project Site. In areas where a SSC is found, work may only occur in these areas after a qualified biologist has determined it is safe to do so. Even so, the qualified biologist shall advise workers to proceed with caution. A qualified biologist shall be on site daily during initial ground and habitat disturbing activities as well as vegetation removal. Then, the qualified biologist shall be on site weekly or bi-weekly (once every two weeks) for the remainder of the Project phase until the cessation of all ground and habitat disturbing activities,

as well as vegetation removal, to ensure that no wildlife is harmed.

The biological monitor(s) shall have appropriate handling permits or shall obtain appropriate handling permits to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with Project construction and activities.

A Scientific Collecting Permit is required to monitor Project impacts on wildlife resources, as required by environmental documents, permits, or other legal authorizations; and, to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with otherwise lawful activities (14 Cal. Code of Regs. Section 650). The CDFW's Scientific Collection Permits webpage (https://wildlife.ca.gov/Licensing/Scientific-Collecting#53949678) provides additional information.

If any SSC are harmed during relocation or a dead or injured animal is found, work in the immediate area shall stop immediately, the qualified biologist should be notified, and dead or injured wildlife be documented immediately. A formal report shall be sent to CDFW within three calendar days of the incident or finding. The report shall include the date, time of the finding or incident (if known), and location of the carcass or injured animal and circumstances of its death or injury (if known). Work in the immediate area may only resume once the proper notifications have been made and additional mitigation techniques have been identified to prevent additional injury or death.

Response to Comment No. A1-9

The commenter states that Mitigation Measure MM-BIO-2 in the Draft EIR may not be sufficient to result in sufficient avoidance and mitigation for direct, indirect, and temporal impacts to California Species of Special Concern (SCC) that may occupy the Project Site. The commenter suggests take of SSC could require a mandatory finding of significance under CEQA. The commenter recommends the addition of pre-construction surveys for SSC and biological monitoring during ground- and habitat-disturbing activities to relocate any SSC that may be present. The commenter also states that a Scientific Collecting Permit would be required if the capture, temporary possession, and relocation of wildlife is necessary during project construction activities. The commenter provides recommended revisions to Mitigation Measure MM-BIO-3 for nesting birds. The commenter states the requirements for reporting observations of special status species, requests submittal of observation data to the California Natural Diversity Database should any special-status species be detected and provides guidance for submittal.

The SSC with potential to occur on the Project Site have wide geographic ranges. As analyzed in Section 4.3, Biological Resources, of the Draft EIR, the injury or death of limited individuals of SSC, if present, would not meet the threshold of significance for biological resources in Appendix G: Environmental Checklist Form of the CEQA Guidelines for a "substantial adverse

effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW or the United States Fish and Wildlife Service." In addition, the threshold for a mandatory finding of significance is to "substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, or threaten to eliminate a plant or animal community." The injury or death of limited individuals of SSC, if present, due to Project construction activities would not contribute to a loss of population viability of these species and would not result in impacts that would meet this threshold of significance. As a result, additional mitigation measures requiring focused surveys for SSC species are not necessary to reduce Project impacts to a less-than-significant level. Nevertheless, as shown above, to be responsive to the commenter's concerns, Mitigation Measure MM-BIO-1 has been revised to include a relocation and avoidance plan, worker awareness training, and additional details regarding biological monitoring responsibilities and protocols, even though their inclusion is not necessary to reduce Project impacts to a less-than-significant level. The Project would comply with the requirements of a Scientific Collecting Permit in the specific situations in which a Scientific Collecting Permit is required. Mitigation Measure MM-BIO-3 as presented in the Draft EIR is sufficient to maintain compliance with the Migratory Bird Treaty Act and California Fish and Game Code. The recommended increases in nest buffer distances are neither necessary nor practicable given the urban nature of the area that surrounds the Project Site. All detected special status species would be reported to the California Natural Diversity Database in accordance with the requirements of PRC Section 21003(e).

While portions of the extension of Dockweiler Drive would be constructed in conjunction with the Project, these elements were previously evaluated in the Lyons Avenue/Dockweiler Drive Extension Project EIR (SCH 2013082016), which is available for review at the following website: https://www.santa-clarita.com/city-hall/departments/public-works/capital-improvement-projects/proposed-dockweiler-drive-extension.

Response to Comment No. A1-10

The Project would comply with the payment of fees upon filing of the Notice of Determination. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A1-11

CEQA Guidelines Section 15088(b) requires the City of Santa Clarita, as the lead agency, to provide a written response to comments on environmental issues received from a public agency at least 10 days prior to certifying the EIR. Accordingly, CDFW will have an opportunity to review the responses provided above. The City will also provide CDFW notification of Planning Commission and City Council hearings for the Project.

Response to Comment No. A1-12

The commenter provides recommended language and mitigation measures to be incorporated into the Project's Draft EIR, which summarize their prior comments. Specific responses to these recommendations are provided in Responses to Comments No. A1-5 through A1-9.

LETTER A2

METROLINK

May 22, 2023

Ms. Erika Iverson, Senior Planner
City of Santa Clarita
Attn: Shadowbox Studios Project Draft EIR
23920 Valencia Boulevard, Suite 302
Santa Clarita, CA 91355

RE: Shadowbox Studios Project Draft EIR Comments

Dear Ms. Iverson:

Following review of the proposed Shadowbox Studios Project Draft EIR, the Southern California Regional Rail Authority (SCRRA) submits the following comments on key issues related to SCRRA and operations of the railroad adjacent to the project site.

As background information, SCRRA is a five-county Joint Powers Authority (JPA) that operates the regional commuter rail system known as Metrolink. Additionally, SCRRA provides rail engineering, construction, operations, and maintenance services to its five JPA member agencies. The JPA consists of the Los Angeles County Metropolitan Transportation Authority (Metro), San Bernardino County Transportation Authority (SBCTA), Orange County Transportation Authority (OCTA), Riverside County Transportation Commission (RCTC), and Ventura County Transportation Commission (VCTC). **A2-1**

The railroad right of way (ROW) adjacent to the proposed project is a heavily trafficked railroad mainline. Trains are operated on the mainline and the ROW is maintained by SCRRA but owned by Metro. In addition to several freight trains operated daily, 28 Metrolink trains operate on weekdays through this corridor. Fewer trains operate on the weekends. Rail traffic along this corridor occurs 24 hours a day, seven days a week, and is expected to increase in the future to address growing demands.

The proposed modifications to the roadways at the railroad crossings and the railroad crossings themselves should account for the future addition of more tracks through the crossing. Given the width of the right of way here, the design should support up to at least three tracks being added. In addition, the Site Plan (Exhibit 3) seems to show the development encroaching on the ROW, which would not be **A2-2**

acceptable. This would need to be clarified, as it is not possible to tell what the encroaching elements are from the level of detail in the image. **A2-2 Continued**

Furthermore, the project location is located less than one mile from our Newhall Metrolink Station, which presents potential transit connectivity benefits to the full-service film and television studio campus. The project is conditioned to provide a Class I multi-purpose path which could provide a link for pedestrians and bicyclists to the Newhall Station and Old Town Newhall. This scenario would be ideal for mitigating transportation/traffic impacts, greenhouse gas emissions, air quality, etc. by encouraging employees and students to use public transportation. The Newhall Station is part of the Antelope Valley Line and we plan to increase the frequency to hourly with more midday service in the near future. Creating pedestrian and cyclist access to the Newhall Station would allow campus users to access this rail service. **A2-3**

Please find the general comments to the project Draft EIR review related to the railroad and its operations listed below.

1. All drainage from the development must drain away from the railroad corridor. This includes any irrigation runoff for landscaping along the railroad corridor.

2. All trees must be set back from the ROW line so that when fully matured, the trees do not hang over the ROW line onto railroad property.

3. A 6' fence is required along the railroad Property line. Since this will be a medium/high density office development, it is recommended that a 6' minimum high block wall be constructed along the railroad corridor instead of a fence to better secure access to the railroad ROW. **A2-4**

4. If noise from train operation is a concern, the City or Developer should conduct a noise study and consider constructing a sound barrier along the railroad property line.

5. Any proposed roadway/railroad or pedestrian/ railroad crossing improvements, whether at-grade or grade separated, must be coordinated with the California Public Utilities Commission (CPUC) and SCRRA.

6. Any proposed utility crossings with the railroad must be coordinated with SCRRA.

7. Adequate lighting should be provided on the property along the railroad corridor to deter trespassing onto the railroad ROW.

8. Site development plans (grading, drainage, landscaping, lighting, etc.) should be provided to SCRRA for review.

9. To assess any requirements for construction (including demolition or alteration of structures) adjacent to the railroad, plans for construction should be sent to Metrolink Right of Way at the following address:

   SCRRA - Pomona Office
   2700 Melbourne Ave
   Pomona, CA 91767

   Plans may be sent to the Metrolink Right of Way contact email at RightofEntry@scrra.net and you may access the Right of Way (ROW) Encroachment website at RIGHT OF WAY (ROW) ENCROACHMENT (metrolinktrains.com) for more information on the process.

A2-4
Continued

Thank you again for allowing us to provide commentary.

If you have any questions, please contact Roderick Diaz, Director of Planning and Development at (213) 452-0455 or via e-mail at diazr@scrra.net.

Sincerely,

Paul R. Hubler

Paul R. Hubler
CHIEF STRATEGY OFFICER

Letter No. A2
Paul Hubler, Chief Strategy Officer
Southern California Regional Rail Authority/ Metrolink
900 Wilshire Boulevard, Suite 1500
Los Angeles, CA 90017

Response to Comment No. A2-1

This introductory comment acknowledges receipt of the Draft EIR for the Project and introduces specific comments from the Southern California Regional Rail Authority (SCRRA). The comment also identifies SCRRA as a five-county Joint Powers Authority (JPA) that operates the regional commuter rail system, known as Metrolink, and provides rail engineering, construction, operations, and maintenance services to the Los Angeles County Metropolitan Transportation Authority (Metro), San Bernardino County Transportation Authority (SBCTA), Orange County Transportation Authority (OCTA), Riverside County Transportation Commission (RCTC), and Ventura County Transportation Commission (VCTC). The comment also describes the railroad right-of-way (ROW) adjacent to the Project Site and its operation. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no response is warranted.

Response to Comment No. A2-2

The proposed grade crossing modifications layout and the number of tracks were closely coordinated with Metrolink for several years, including multiple diagnostics meetings, and do not preclude expansion for additional tracks. The Metrolink Engineering team reviewed and accepted the proposed configuration. The proposed grading within the ROW was requested by the Metrolink Engineering team to address some drainage erosion to the existing tracks. If Metrolink would like to change this request, the Project would be able to accommodate that accordingly.

Response to Comment No. A2-3

The comment recognizes that the proximity of the Jan Heidt Newhall Metrolink Station to the Project Site and the conditions imposed on the Project, including the provision of a Class I multi-purpose path that could provide a link for pedestrians and bicyclists to the Jan Heidt Newhall Metrolink Station and Old Town Newhall, present potential transit connectivity benefits to the Project, as well as for mitigating transportation/traffic impacts, GHG emissions, and air quality impacts, by encouraging employees to use public transportation. SCRRA plans to increase the frequency of service to the Antelope Valley Line, which includes the Jan Heidt Newhall Metrolink Station, to hourly with more midday service in the future. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no response is warranted.

Response to Comment No. A2-4

The comment provides general comments related to the railroad and its operations. The responses below correspond to each comment listed.

1. All runoff from the Project would be captured in a closed pipe system and conveyed to Placerita Creek. Prior to discharging into Placerita Creek the first flush runoff would be routed through either a system of underground infiltration chambers or an infiltration/drainage basin. Additionally, off-site runoff coming from under 12th street would be routed through the Project Site to Placerita Creek. A portion of this off-site stormwater during peak storm events would be routed to the infiltration/drainage basin to offset the

developed hydromodification flowrate and volume requirements. In addition, existing stormwater flows from 13th Street would be conveyed through the Project Site to the existing downstream Metrolink drain lines. Accordingly, all drainage from the Project, including irrigation runoff for landscaping, would drain away from the railroad corridor.

2. All trees would be set back from the railroad ROW to avoid encroachment into railroad property.
3. A 12-foot tall security fence primarily made of woodcrete would be installed along the majority of the perimeter of the Project Site. Open rail wrought iron fencing would be installed along the southwestern corner of the Project Site, adjacent to the proposed office building.
4. The proposed support building, which would extend along the majority of the western boundary of the Project Site, would provide the necessary acoustical buffer from the railroad noise to the sound stages.
5. The Project will coordinate with the California Public Utilities Commission (CPUC) and SCRRA and secure required permits and/or approvals regarding any proposed roadway/railroad or pedestrian/railroad crossing improvements associated with the Project.
6. The Project will coordinate with the CPUC and SCRRA and secure required permits and/or approvals regarding any utility lines crossing the railroad ROW.
7. Pole-mounted drive aisle lights would be installed along the 12-foot tall woodcrete fence along the western boundary of the Project Site.
8. Final site plans will be provided to SCRRA for review.
9. Final plans for construction will be sent to Metrolink Right of Way.

Draft Environmental Impact Report (Draft EIR) for the Proposed Shadowbox Studios Project [Master Case 21-109] (Proposed Project)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The City of Santa Clarita is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. The following comments include recommended revisions to the project-level air quality mitigation measures, operational emissions from stationary and portable sources, Localized Significant Thresholds (LSTs) for construction and operational emissions analysis, health risk impacts during operation, and information about South Coast AQMD air permits that the Lead Agency should include in the Revised Draft EIR or the Final EIR. **A3-1**

South Coast AQMD Staff's Summary of Project Information in the Draft EIR

Based on the Draft EIR, the Lead Agency proposes construction of a 1,294,500 square-foot film and television studio campus on a currently vacant 93.5-acre parcel of land.[1] The Proposed Project is located near the northeast corner of Railroad Avenue and 13th Street in Santa Clarita. The overal site includes approximately: 1) 476,000 square feet of sound stages; 2) 571,000 square feet of workshops, warehouses and support uses; 3) 210,000 square feet of production and administrative offices; and 4) 37,500 square feet of catering and other specialty services.[2] Additionally, the Proposed Project seeks to build a bridge across Placerita Creek to provide employee access to a graded parking area located on the north side of Placerita Creek.[3] Based on a review of aerial photographs, South Coast AQMD staff finds that the nearest sensitive receptor (e.g., residence) is located within 25 feet north of the Proposed Project. The construction period is anticipated to last 25 months, which is expected to begin in 2023 and end in 2025.[4] **A3-2**

South Coast AQMD Staff's Comments on the Draft EIR

Operational Emissions from Stationary and Portable Sources

The Draft EIR states that operational criteria pollutant emissions are expected from the use of stationary source, six emergency generators operating four hours per day.[5] However, given the **A3-3**

[1] Draft EIR, p. ES-1.
[2] Ibid. p. 1.
[3] Ibid. p. 1.
[4] Ibid. p. 26.
[5] Ibid. p. 4.2-19.

Proposed Project's expansive scale, additional stationary and/or portable sources, which may include but are not limited to internal combustion engines, boilers, and spray booths, are typical equipment that would likely be utilized within the film and television studio campuses. Failing to account for these additional potential operational stationary and portable sources and the associated emissions in the analysis could lead to an underestimation of the total operational emissions.

Furthermore, upon examination of the Excel file titled "Generator and Food Truck Assumptions," provided by the Lead Agency, the "Max Generator Emissions – Daily" values were multiplied by 12 to derive the "Max Generator Emissions - 4 hours" without providing the basis, equations and documentation supporting the reasoning behind the math. As such, staff was not able to determine how the total annual DPM emissions were calculated. Therefore, the Lead Agency is recommended to provide further clarification and supporting documentation regarding the calculation methodology for determining the operating hours of the emergency generator and quantifying the projected emissions.

A3-3 Continued

Localized Significant Thresholds (LSTs) Analysis for Construction and Operational Activities

The Draft EIR contains an LST analysis of localized air quality construction and operation impacts to sensitive receptors in the vicinity of the Proposed Project as presented Appendix C – Air Quality and Greenhouse Gas Emissions Study,[6] Table 8 - Onsite Construction Emissions and Table 9 - Onsite Operation Emissions. The localized emissions were determined by relying on the Mass Rate LST Look-up Tables developed by South Coast AQMD.[7] However, based on aerial maps provided in the Draft EIR, the footprint of the Proposed Project spans approximately 93.5 acres, which is substantially larger than the allowed maximum footprint of five-acres in the Mass Rate LST Look-up Tables. In addition, it appears that the closest sensitive receptor (residence) is located adjacent to or within 25 feet north of the Proposed Project site but the Draft EIR relied upon emission screening criteria based on a distance of 82 feet (25 meters) for a five-acre site.[8] To remedy these inconsistencies, a re-evaluation of the localized construction and operational emissions by conducting air dispersion modeling, in lieu of relying on the Mass Rate LST Look-up Tables, is more appropriate for accurately predicting the ground-level concentrations needed for the LST analysis because air dispersion modeling takes into account project-specific factors such as: 1) the total acreage to be disturbed; 2) building downwash effects; 3) emissions and location of expected mobile sources, permitted sources, and other sources on-site.

A3-4

Therefore, South Coast AQMD staff recommends that the Lead Agency revise the LST analyses for project construction and operation by conducting air dispersion modeling and including the results of this analysis in either a Revised Draft EIR or Final EIR. If a revised LST analysis is not included in the Revised Draft EIR or Final EIR, the Lead Agency should provide reasons supported by substantial evidence in the record to explain why.

A3-5

[6] Appendix C Air Quality and Greenhouse Gas Emissions Study. Page 37.
[7] South Coast AQMD, Mass Rate LST Look-up Tables: http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/appendix-c-mass-rate-lst-look-up-tables.pdf
[8] Draft EIR. p. 4.2-13.

Health Risk Assessment (HRA) during Project Operation

CEQA Guidelines Sections 15126.2 and 15126.4 require a Draft EIR to include a description of the significant environmental effects of a Proposed Project, significant environmental effects which cannot be avoided, significant irreversible environmental changes, growth-inducing impacts, and mitigation measures proposed to minimize the significant adverse impacts. An impact is considered significant under CEQA if it leads to a "substantial, or potentially substantial, adverse change in the environment." In addition to the air quality impacts from the criteria air pollutants and greenhouse gases, the adverse air quality health risk impacts associated with increased emissions of toxic air contaminants (TACs) from all sources (including but not limited to expected future permitted stationary and portable sources, mobile sources, and other emission sources) during the operation phases need to be appropriately evaluated using qualitative and/or quantitative approaches to justify whether there will be potentially substantial adverse impacts.

However, the Draft EIR for the Proposed Project did not contain a comprehensive assessment of the health risk associated with mobile, stationary and portable sources during the operation phase. Please refer to the South Coast AQMD's guidance for performing a mobile source health risk assessment.[9] As a result, the potential cancer risk linked to the Proposed Project is unknown and undisclosed. This omission is concerning because the operation of a film and television studio campus is expected to involve various diesel-powered stationary and portable sources and vehicles that emit Diesel Particulate Matter (DPM), known as an air toxic and carcinogen. According to n Table 4 in the Transportation Assessment of the Draft EIR,[10] the total net new vehicle trips are 605 and 684 in the morning and the afternoon peak hours, respectively during operation of the Proposed Project. However, the Draft EIR did not mention how many of these truck trips are used for daily operations. Therefore, the Lead Agency is recommended to revise and identify the number of trucks potentially involved in the operational activities and include them in the Revised Draft EIR or Final EIR. If this additional information is not included in the Revised Draft EIR or Final EIR, the Lead Agency should provide reasons supported by substantial evidence in the record to explain why. A3-6

As mentioned earlier in this letter, the aerial maps indicate that the nearest sensitive receptor, a residential area, is located adjacent to or within 25 feet north of the Proposed Project site. As such, the Lead Agency is recommended to conduct an operational phase HRA, which should include evaluating truck emissions (including the truck routes to and from the site, truck loading/unloading docks, and their proximity to the sensitive receptors) and the impact of diesel-powered stationary and portable sources under the foreseeable probable future conditions. An HRA assessment is essential for determining the potential cancer risk impacts associated with the operation of the Proposed Project to the offsite sensitive receptors and workers so that they can be compared to the South Coast AQMD Air Quality Significance Thresholds for TACs[11] to determine whether there will be a potentially significant air quality impact. The analysis should also disclose the potential health risks for chronic and acute impacts of the Proposed Project's

[9] South Coast AQMD's guidance for performing a mobile source health risk assessment is available at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis.

[10] Transportation Assessment, Table 4. p. 25.

[11] South Coast AQMD. Air Quality Significance Thresholds. https://www.aqmd.gov/docs/default-source/ceqa/handbook/south-coast-aqmd-air-quality-significance-thresholds.pdf

operation on residents living and/or workers working outside the Proposed Project's boundary in the Revised Draft EIR or Final EIR. If an HRA is not included in the Revised Draft EIR or Final EIR, the Lead Agency should provide reasons supported by substantial evidence in the record to explain why.

A3-6 Continued

South Coast AQMD Air Permits and Responsible Agency Role

If construction of the Proposed Project requires using the new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, spray booths, and etc., air permits from South Coast AQMD will be required. The Revised Draft EIR or Final EIR should include a discussion on stationary and portable equipment requiring South Coast AQMD permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project. Any assumptions used for the stationary and portable sources in the Revised Draft EIR or the Final EIR will also be used as the basis for the permit conditions and limits for the Proposed Project. Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions relative to air permits. General information on air permits is also available on South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits.

A3-7

Conclusion

Pursuant to California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(b), the Lead Agency is required to provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to certifying the Revised Draft EIR or the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with the recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

A3-8

We appreciate the opportunity to review the Proposed Project. Thank you for considering these comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Sahar Ghadimi, Air Quality Specialist, at sghadimi@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Response to Comment No. A3-1

The comment introduces South Coast Air Quality Management District (South Coast AQMD) comments on the Draft EIR and summarizes the specific concerns of the comments, including recommended revisions to the Project-level air quality mitigation measures, operational emissions from stationary and portable sources, Localized Significant Thresholds (LSTs) for construction and operational emissions analysis, health risk impacts during operation, and information about the South Coast AQMD permits that the commenter recommends the Lead Agency include in the Final EIR. Responses to specific comments are provided below in Response to Comment Nos. A3-3 through A3-6.

Response to Comment No. A3-2

The comment summarizes the Project description, location within the broader community, location of the nearest sensitive receptor, and the anticipated year of completion of Project construction. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no response is warranted.

Response to Comment No. A3-3

The comment notes that the Draft EIR included the operation of six emergency generators operating for up to four hours per day. The comment further stated that, given the nature of the Project, other stationary sources, such as boilers, internal combustion engines, and spray booths, could be typical of the film and television studio campus. It further asserts that failing to account for these additional sources could lead to an underestimation of the total operational emissions.

Subsequent to the initial analysis, it was determined that no generators would be included as part of the base Project. Generators, as needed, would be brought on-site by individual production entities, which would need to permit the generator use independent of the Project development. No changes to the emissions inventories in the Draft EIR have been made as emission levels are less than significant even with the inclusion of emissions from the previously assumed six generators. Thus, the emissions inventory and impact analysis in the Draft EIR are conservative.

Currently, it is unknown if any other permitted or non-permitted stationary or portable sources of toxic air pollutants (TACs) or pollutants would be included as part of the Project. Therefore, the EIR correctly analyzed the known. CEQA does not require the analysis of activities that are not known parts of the Project. It would be speculative at best to assume any of the mentioned sources. Accordingly, no additional analysis is necessary.

Additionally, the comment states that daily values for generator emissions were multiplied by 12 to derive the maximum emissions of four hours per day but was unable to determine how the emissions, specifically diesel particulate matter (DPM), were calculated. As stated in the assumptions, the six generators were assumed to be Tier 3 based on the data sheet for the model anticipated to be used. The generators were assumed to operate 20 minutes per month for testing.

Daily emissions in CalEEMod were estimated for all generators operating for 20 minutes per day once a month for testing purposes. The "mitigated" CalEEMod scenario resulted in a total of 0.0776 pounds per day of PM_{10} for the operation of all of the generators during the day. Then the 20 minutes of emissions were multiplied by three to get total emissions for an hour; that amount was multiplied by four to represent the total emissions for a maximum day when all generators would be operated for four hours. This was a worst-case representation of emissions. Therefore, the daily emissions for all generators operated for 20 minutes multiplied by 12 (3x4) would equal the maximum daily emissions for all generators operating for four hours in one day. As is typical of analysis where DPM is not directly monitored, PM_{10} is substituted for DPM. Therefore, total DPM emissions for the day would be the 0.0776 pounds per day multiplied by 12 or 0.9312 pounds per day as identified in the Draft EIR. Regardless, as discussed above, the base Project does not include generators, and, thus, the inclusion of emissions from generators in the Project's emissions inventory represents a conservative analysis.

Response to Comment No. A3-4

The comment states that due to the size of the Project Site, air dispersion modeling is a more appropriate analysis for determining significance for localized impacts than the use of the Mass Rate Look-Up tables, which formed the basis for the analysis. Specifically, the comment states, "it appears that the closest sensitive receptor (residence) is located adjacent to or within 25 feet north of the Proposed Project site but the Draft EIR relied upon emission screening criteria based on a distance of 82 feet (25 meters) for a five-acre site." The Mass Rate Look-Up tables were used as it is anticipated that less than five acres per day would be disturbed during construction activities. Additionally, the Draft EIR followed the South Coast AQMD's guidance, which states, "Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters."[5] On-site emissions from operational activities are minimal and well below the Mass Rate Look-Up values at no more than half of the screening threshold, even with the inclusion of six generators, which are no longer part of the Project. Removing the generators from the analysis would result in the following operational LST emissions analysis:

- NOx: 1 pound per day compared to a screening threshold of 236 pounds per day
- CO: 2 pounds per day compared to a screening threshold of 1,644 pounds per day
- PM_{10}: <1 pound per day compared to a screening threshold of 3 pounds per day
- $PM_{2.5}$: <1 pound per day compared to a screening threshold of 2 pounds per day

Given the low level of on-site operational emissions and the absence of any stationary sources, the Project is not anticipated to result in significant emissions regardless of the modeling methodology used.

Response to Comment No. A3-5

The comment states that the South Coast AQMD recommends the LST analysis be revised by conducting air dispersion modeling and including the results in a revised Draft EIR or a Final EIR. As explained in Response to Comment No. A3-4 above, the use of the Mass Rate Look-Up tables

[5] South Coast Air Quality Management District, Final Localized Significance Threshold Methodology, July 2008, p. 3-3.

is appropriate because it is anticipated that less than five acres per day would be disturbed during construction and operational emissions are negligible with respect to the thresholds. Therefore, dispersion is not necessary. See Response to Comment No. A3-4 above for additional information.

Response to Comment No. A3-6

The comment states that the Draft EIR did not contain a comprehensive assessment of health risk associated with mobile, stationary, and portable sources during Project operations. As discussed in detail in Response to Comment No. A3-3 above, there are no additional known sources of stationary or portable TACs associated with the operation of the Project. Additionally, generators would not be part of the Project and, as needed, would only be implemented by production that was leasing space from the studio. These generators would need to be permitted through the South Coast AQMD and the risk associated with the generators would be required to be below regulatory thresholds as part of the permitting process.

With respect to mobile sources, the comment questions the number of diesel trucks, and hence the DPM emissions, that would be associated with the Project. As discussed in the Level of Service Analysis of Gate 3 Modification Memorandum (included in Appendix L of the Draft EIR), the Project would result in a total of 7,293 vehicles per day.[6,7] Of those, 182 would be trucks, with 44 in the AM Peak hour and 38 in the PM peak hour. Of the 182 trucks, 15 percent (or ~28 trucks) would be Heavy Duty or Medium Heavy Duty Trucks; 55 percent (or ~101 trucks) would be Light Heavy Duty trucks, and 30 percent (or ~55 trucks) would be Medium Duty vehicles. Based on EMFAC 2021, approximately 85 percent of the Heavy Duty and Medium Heavy Duty vehicles, 39 percent of the light heavy duty vehicles, and 1 percent of the medium duty vehicles would be diesel.[8] This results in a total number of diesel trucks of 65. Even assuming 100 percent of Heavy and Medium Heavy duty trucks were diesel would result in less than 70 diesel trucks accessing the Project Site per day. Based on the California Air Resources Board's (CARB) 2005 Air Quality and Land Use Handbook, distribution centers with 100 or more diesel trucks per day or 40 or more diesel transport refrigeration units (TRUs) per day warrant the preparation of a health risk assessment (HRA) for mobile sources.[9] Therefore, given the number of diesel trucks being less than 100 and the nature of the development not requiring TRUs, there would not be a need for an operational HRA to evaluate mobile sources. Therefore, no operational HRA is required for the Project as part of the CEQA process.

Response to Comment No. A3-7

The Project will coordinate with the South Coast AQMD regarding any required air permits for the operation of stationary and portable sources. In addition, the comment updates the list of other agency approvals that would be required for the Project, as presented in Section 2.5.2, Other Agencies, of the Draft EIR, as follows:

6 Gibson Transportation Consulting, Inc., Level of Service Analysis of Gate 3 Modification Alternate Designs of Arch Stret & 13th Street LA-1 Shadowbox Studios, Santa Clarita, California, 2023.
7 Shadowbox Trip Generation Totals (included as **Attachment 2** to this Final EIR).
8 EMFAC Emission Rates for SCAQMD Calendar Year 2024 (included as **Attachment 3** to this Final EIR).
9 California Air Resources Board, Air Quality and Land Use Handbook: A Community Health Perspective. April 2005.

- The following was added after the last bullet on page 2.0-25 in Section 2.0, Project Description of the Draft EIR (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  To allow for operation of equipment emitting air pollutants, including, but not limited to, emergency generators and fire water pumps, the following permit would be required:

  - Air Permits from South Coast AQMD

This addition does not result in the Project creating any new or increased significant environmental impact that was not already identified in the Draft EIR.

Response to Comment No. A3-8

The comment requests written responses to South Coast AQMD comments prior to certification of the Final EIR. The City will provide written responses to all comments contained in this letter at least 10 days prior to certification of the Final EIR pursuant to PRC Section 21092.5(a) and CEQA Guidelines Section 15088. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Santa Clarita, CA 91355

Dear Ms. Iverson:

THE DRAFT ENVIRONMENTAL IMPACT REPORT, "SHADOWBOX STUDIOS PROJECT" REQUESTS ENTITLEMENTS FOR THE DEVELOPMENT OF APPROXIMATELY 1.3 MILLION SQUARE FOOT FULL-SERVICE FILM AND TELEVISION STUDIO CAMPUS ON APPROXIMATELY A 93-ACRE SITE, CITY OF SANTA CLARITA, FFER2023002205

The Draft Environmental Impact Report reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department. **A4-1**

The following are their comments:

PLANNING DIVISION: **A4-2**

We have no comments.

For any questions regarding this response, please contact Kien Chin, at (323) 881-2404 or Kien.Chin@fire.lacounty.gov.

LAND DEVELOPMENT UNIT:

The development of this project must comply with all applicable code and ordinance requirements for construction, access, water mains, fire flows and fire hydrants. **A4-3**

Specific fire and life safety requirements for the construction phase will be addressed at the Fire Department building plan check review. There may be additional fire and life safety requirements during this time.

LETTER A4 Continued

Every building constructed shall be accessible to Fire Department apparatus by way of access roadways, with an all-weather surface of not less than 28 width. The roadway shall be extended to within 150 feet of all portions of the exterior walls when measured by an unobstructed route around the exterior of the building. The roadway shall provide approved signs and/or stripping stating "NO PARKING - FIRE LANE" and shall be maintained in accordance with the County of Los Angeles Fire Code.

The fire hydrant requirements listed in Section's 4.13-9 and 4.17-13 shall be corrected to the following:
1) Install 8 public fire hydrants as noted by the Fire Department. All required public fire hydrants shall be installed, tested, and accepted prior to beginning construction.
2) Install 21 public on-site fire hydrants as noted by the Fire Department due to the size of development and to comply with Fire Protection System requirements. All required public on-site fire hydrants shall be installed, tested, and accepted prior to beginning construction.
3) Install 15 private on-site fire hydrants as noted by the Fire Department. All required private on-site fire hydrants shall be installed, tested, and approved prior to building occupancy.

A4-3 Continued

The fire flow requirements in Section's 4.16-24 and 4.17-13 shall be corrected to the following:
1) The required fire flow for the public fire hydrants and public on-site fire hydrants for this project is 4000 GPM at 20 psi residual pressure for 4 hours. Three (3) public fire hydrants flowing simultaneously may be used to achieve the required fire flow. An approved automatic fire sprinkler system is required for the proposed buildings within this development.
2) The required fire flow for the public fire hydrants and public on-site fire hydrants for this project is 4000 GPM at 20 psi residual pressure for 4 hours. Three (3) public fire hydrants flowing simultaneously may be used to achieve the required fire flow. An approved automatic fire sprinkler system is required for the proposed buildings within this development.

The north section of this property is located within the area described by the Fire Department as a Fire Hazard Severity Zone. A “Fuel Modification Plan” shall be submitted to the Fuel Modification for review by the Fuel Modification Unit prior to public hearing. Please contact the Department’s Fuel Modification Unit for details. The Fuel Modification Plan Review Unit is located at 605 North Angeleno Avenue in the City of Azusa CA 91702-2904. They may be reached at (626) 969-5205 or visit https://www.fire.lacounty.gov/forestry-division/forestry-fuel-modification

A4-4

Appendix N (Fire Protection Plan) needs to be submitted for review.

The Land Development Unit appreciates the opportunity to comment on this project. Should any questions arise, please contact Wally Collins at (323) 890-4243 or Wally.Collins@fire.lacounty.gov.

LETTER A4 Continued

FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:

Under the Los Angeles County Oak Tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any tree of the oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured at 4 ½ feet above mean natural grade. An Oak Tree Permit is required for this project. Specific questions regarding oak tree permit requirements should be directed to the Los Angeles County Department of Regional Planning at (213) 974-6411.

A4-5

The statutory responsibilities of the County of Los Angeles Fire Department, Forestry Division include erosion control, watershed management, rare and endangered species, brush clearance, vegetation management, fuel modification for Fire Hazard Severity Zones, archeological and cultural resources, and the County Oak Tree Ordinance. Potential impacts in these areas should be addressed.

For any questions regarding this response, please contact Forestry Assistant, Matthew Ermino at (818) 890-5719.

HEALTH HAZARDOUS MATERIALS DIVISION:

The Health Hazardous Materials Division of the Los Angeles County Fire Department has no comments or requirements for the project at this time.

A4-6

Please contact HHMD Hazardous Materials Specialist III, Jennifer Levenson at (323) 890-4114 or Jennifer.Levenson@fire.lacounty.gov if you have any questions.

Very truly yours,

RONALD M. DURBIN, CHIEF, FORESTRY DIVISION
PREVENTION SERVICES BUREAU

RMD:pg

Letter No. A4
Ronald M Durbin, Chief, Forestry Division
Prevention Services Bureau
County of Los Angeles Fire Department
1320 North Eastern Avenue
Los Angeles, CA 90063-3294

Response to Comment No. A4-1

The comment introduces specific comments from the different divisions within the County of Los Angeles Fire Department (LACoFD). The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A4-2

The comment acknowledges that the LACoFD Planning Division has no comments on the Draft EIR. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A4-3

The Project would be required to comply with all applicable LACoFD code, as adopted by the City of Santa Clarita, and ordinance requirements for construction, access, water mains, fire flows, and fire hydrants at LACoFD building plan check review and before the Building Official issues building permits and certificates of occupancy.

The comment adds to and corrects the information presented in the Draft EIR regarding the number of fire hydrants that would be required for the Project. Accordingly, the second to last sentence in the last full paragraph on page 4.13-9 in Section 4.13, Public Services, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

> The proposed buildings would be equipped with an approved automatic fire sprinkler system. In addition, ~~As~~ discussed in Section 4.16, Utilities and Service Systems, the Project would be required to install 8 public fire hydrants and ~~36~~ 21 public on-site fire hydrants, which would need to be installed, tested, and accepted by LACoFD prior to construction, and 15 private on-site fire hydrants, which would need to be installed, tested, and accepted by LACoFD prior to building occupancy. ~~to accommodate the development.~~

In addition, the comment corrects the information presented in the Draft EIR regarding the fire flow requirements for the Project. Accordingly, the first three sentences in the second paragraph under Threshold 4.16(a) on page 4.16-24 in Section 4.16, Utilities and Service Systems, of the Draft EIR, were revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

> In addition, the Project would install 8-inch water meters (rated for 3,500 gpm continuous flow and 4,700 gpm as the maximum intermittent flow) in order to meet the fire-flow requirements for the Project, which is set at ~~2,500 gpm for 2 hours~~ 4,000 gpm for 4 hours at 20 psi. Three public fire hydrants flowing simultaneously may be used to achieve the required fire flow.~~With regard to public fire flow, the~~

> ~~Los Angeles County Fire Department's Fire Prevention Division has stipulated a requirement of 4,000 gpm at 20 psi for a duration of 4 hours. If multiple hydrants are used to meet this requirement, each hydrant would be required to have a flow of 1,250 gpm minimum for 2 hours at 20 psi.~~

Furthermore, the comment adds to and corrects the information presented in the Draft EIR regarding the number of fire hydrants and fire flow that would be required for the Project. Specifically, the second full paragraph on page 4.17-13 in Section 4.17, Wildfire, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

> ~~Pursuant to County Code Section 20.16.060, the Project Site would meet a 2-hour on-site fire flow requirement of 2,500 gallons per minute (gpm) with a residual pressure of 20 pounds per square inch (psi).~~ As discussed in Section 4.16, Utilities and Service Systems, of this Draft EIR, the Project would install 8-inch water meters (rated for 3,500 gpm continuous flow and 4,700 gpm as the maximum intermittent flow) in order to provide adequate fire flow support on-site. Furthermore, as required by the Santa Clarita Valley Water Agency (SCV Water), the Project's service connections and metering would be sized for dual service for domestic and fire water needs. The LACoFD's Fire Prevention Division has also stipulated a public fire flow requirement of 4,000 gpm at 20 psi for a duration of 4 hours. Three public fire hydrants flowing simultaneously may be used to achieve the required fire flow. ~~If multiple hydrants are used to reach this requirement, each hydrant used would be required to have a flow of 1,250 gpm minimum for 2 hours at 20 psi, which would require the~~ Project would be required to install 8 public fire hydrants and ~~36~~ 21 public on-site fire hydrants, which would need to be installed, tested, and accepted by LACoFD prior to construction, and 15 private on-site fire hydrants, which would need to be installed, tested, and accepted by LACoFD prior to building occupancy. ~~to accommodate the proposed development.~~ In addition, the Project would connect to existing electrical and telecommunications infrastructure surrounding the Project Site. The required water meters and fire hydrants would comply with SCV Water and LACoFD standards.

These changes do not result in the Project creating any new or increased significant environmental impact that is not already identified in the Draft EIR.

Response to Comment No. A4-4

As identified in the Fire Prevention Plan prepared for the Project (see Appendix N of the Draft EIR), a Fuel Modification Plan will be submitted to LACoFD for review and approval prior to issuance of building permits. The Fire Prevention Plan will be submitted with the Fuel Modification Plan.

It should be noted that the Project would change the existing conditions of the Project Site, as the entire Project Site would either be developed with impervious surfaces or managed landscape areas. As such, the risk of wildfire on the Project Site would be reduced through development of the proposed structures and improvements as compared with existing conditions. By converting the flammable landscape currently existing on the Project Site to a development featuring hardscapes, sound stages, support and ancillary buildings, and irrigated/managed landscaped

areas, the Project would reduce fuel loads found on the Project Site and, thus, reduce the chances of a wildfire occurring or intensifying on-site and threatening surrounding properties. Furthermore, because the Project would not involve storage, use, or disposal of significant quantities of hazardous materials, there would be no significant sources of hazardous materials that could add to the fuel load and produce harmful pollutants in the event of a wildfire.

Response to Comment No. A4-5

As identified in Section 2.0, Project Description, of the Draft EIR, 13 of the 16 oak trees on the Project Site, including seven heritage trees, would be removed to accommodate Project development; three coast live oak trees on the ridge at the north end of the Project Site would be preserved with no anticipated encroachment. However, the Project would replace the removed trees with 211 oak trees, including coast live oak, Engelmann oak, valley oak, and southern live oak, as well as 450 trees of different non-oak varieties, including Bubba desert willow, Tuscarora crape myrtle, Brisbane box, little gem magnolia, fruitless olive, Canary Island pine, icee blue podocarpus, and Columbia plane tree. The Los Angeles County Oak Tree Ordinance is not applicable to the Project, as the site is within the incorporated City of Santa Clarita. Nonetheless, an Oak Tree Permit from the City would be required for the encroachment of the Project into the protected zone and the removal of oak trees.

The comment also identifies the statutory responsibilities of LACoFD's Forestry Division, including erosion control, which is addressed in Sections 4.6, Geology and Soils, and Section 4.9, Hydrology and Water Quality, of the Draft EIR; watershed management, which is also addressed in Section 4.9, Hydrology and Water Quality, of the Draft EIR; rare and endangered species and vegetation, which are addressed in Section 4.3, Biological Resources, of the Draft EIR; fuel modification for VHFHSZ, which is addressed Section 4.17, Wildfire, of the Draft EIR; archaeological and cultural resources, which are addressed in Section 4.4, Cultural Resources, of the Draft EIR; and oak trees, which are also addressed in Section 4.3, Biological Resources, of the Draft EIR.

Response to Comment No. A4-6

The comment acknowledges that LACoFD has no comments or requirements for the Project related to hazardous materials. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

LETTER A5

OFFICE OF THE SHERIFF

COUNTY OF LOS ANGELES

HALL OF JUSTICE

ROBERT G. LUNA, SHERIFF

May 18, 2023

Ms. Erika Iverson, Senior Planner
City of Santa Clarita
Department of Community Development
23920 Valencia Boulevard, Suite 302
Santa Clarita, California 91355

Dear Ms. Iverson:

SHADOWBOX STUDIOS PROJECT (MASTER CASE 21-109)
NOTICE OF AVAILABILITY OF A
DRAFT ENVIRONMENTAL IMPACT REPORT
REVIEW COMMENTS

Thank you for inviting the Los Angeles County Sheriff's Department (Department) to review and comment on the April 2023 Notice of Availability of a Draft Environmental Impact Report (DEIR), for the Shadowbox Studios Project (Project). The proposed Project is located on a vacant 93.5-acre site located at the northeast corner of Railroad Avenue and 13th Street. The project proposes to develop a full-service film and television studio campus of approximately 1,285,800 square feet total building area. The Project consists of 19 sound stages, a three-story production and administrative office building, workshops, warehouses, and support uses. In addition, the Project proposed a five-level parking structure to accommodate 1,072 parking spaces and would have a total of 2,684 parking spaces throughout the project site. A5-1

The proposed Project is located within the service area of the Department's Santa Clarita Valley Sheriff's Station (Station). Due to cumulative impacts, the proposed Project will impact the current level of service provided by the Station for the potential increase in employees, nighttime and daytime population proposed by the Project. The Project Applicant will be required to pay all development fees associated with the project, such as a law enforcement facilities mitigation fee. Accordingly, the Station reviewed the A5-2

DEIR and authored the attached responses (see correspondence dated May 18, 2023, from Captain Justin Diez). A5-2 Continued

Also, for future reference, the Department provides the following updated address and contact information for all requests for reviews comments, law documents, and other related correspondence: A5-3

Tracey Jue, Director
Facilities Planning Bureau
Los Angeles County Sheriff's Department
211 West Temple Street
Los Angeles, California 90012

Attention: Planning Section

Should you have any questions regarding this matter, please contact me, at (323) 526-5657, or your staff may contact Mr. Immanuel Chiang, of my staff, at (323) 526-5637.

Sincerely,

ROBERT G. LUNA, SHERIFF

Tracey Jue, Director
Facilities Planning Bureau

SH-AD-32A (8/17)

LETTER A5 Continued

COUNTY OF LOS ANGELES

SHERIFF'S DEPARTMENT

"A Tradition of Service Since 1850"

DATE: May 17, 2023
FILE NO:

OFFICE CORRESPONDENCE

FROM: JUSTIN R. DIEZ, CAPTAIN
SANTA CLARITA VALLEY
STATION

TO: TRACEY JUE, DIRECTOR
FACILITIES PLANNING BUREAU

SUBJECT: REVIEW COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT REPORT FOR SHADOWBOX STUDIOS PROJECT (MASTER CASE 21-109)

Santa Clarita Sheriff's Station (Station) reviewed the Draft Environmental Impact Report (RDEIR), dated April 2023, for the Shadowbox Studios Project (Project). The project proposes to develop a full-service film and television studio campus on a vacant 93.5-acre site located at the northeast corner of Railroad Avenue and 13th Street. The Project proposes 19 sound stages approximately 475,500 square feet; a three-story production and administrative offices approximately 209,300 square feet; approximately 565,400 square feet of workshops, warehouses, and support uses; and approximately 35,600 square feet of catering and other specialty services. Upon completion, the campus would have an overall building area of approximately 1,285,800 square feet. The project also proposed a five-level, 1,072-space parking structure along with approximately 455 surface parking spaces throughout the main campus and a 1,157-space employee parking lot located on the north side of Placerita Creek for a total of 2,684 parking spaces on the project site. The Project's estimated construction schedule is approximately 2.5 years, starting in April 2024 and ending in September 2026. A5-4

The Station remains concerned that continued growth and intensification of multi-use land uses within the service area will ultimately contribute to significant cumulative impacts from this Project and other developments within the city on our department resources and operations. It is reasonable to expect that continued development will lead to a significant increase in the demand for law enforcement services. Meeting such demands require additional resources, including patrol deputies, other sworn deputies, support personnel, and attendant assets, such as patrol vehicles, support vehicles, communications equipment, weaponry, office furnishings/equipment, etc.

Due to the cumulative impacts of development projects within the city, the calls for service increase in its volume and types. Therefore, the project location may affect the police protection services provided by the Station. The Station recommends effective traffic and security plans be developed to address potential issues from vandalism and burglaries at the proposed Project site, in coordination with all jurisdictional approvals.

Also, the Station reviewed the concept drawings Figure 2-3, 2-12 and 4.1-4 DEIR to provide the following comments:

1. ***Special Protection Requirements or Recommendations:***

a. The proposed Project will benefit from a landscaping maintenance program that would minimize opportunities for individuals to hide. The Station also recommends limiting the height of hedge-type plants around security gates to allow visibility from the street.

A5-4
Continued

b. The installation of security cameras for a video monitoring system and building lights with motion sensors is beneficial, where feasible. Appropriate gate hardware such as keypad/keycard access, automatic gate closers, and tire spike strips can be implemented where feasible to limit unauthorized access and for easy monitoring. In addition, the proposed locations of exterior building security cameras shall be considered in areas where law enforcement can adequately identify vehicle license plates upon entry/exit into the proposed Project with adequate lighting to enhance visibility. Installation of security cameras inside the building at each level's entry/exit points, at the elevators, and at the stairwells can be considered where feasible.

c. Installation of low-level site security lighting throughout the site as required, and where feasible.

d. Effective traffic and security plans be developed to address potential issues from vandalism and burglaries at the proposed Project site, in coordination with all jurisdictional approvals.

e. A Construction Traffic Management Plan should also be established as part of the proposed Project to address construction-related traffic congestion and emergency access issues. If temporary lane closures are necessary for the installation of utilities, emergency access should be maintained at all times. Flag persons and/or detours should be provided as needed to ensure safe traffic operations, and construction signs should be posted to advise motorists of reduced construction zone speed limits. **A5-4 Continued**

At this time, the Station has no further comments on the proposed Project. However, the Station reserves the right to amend or supplement our assessment upon subsequent reviews of the proposed Project once additional information becomes available.

Thank you for including the Station in the review process for the proposed Project. Should you have any questions regarding this matter, please contact Immanuel Chiang, Departmental Facilities Planner I, at (323) 526-5637, of our Facilities Planning Bureau.

Should you have any questions or require additional information, please contact Lieutenant Brandon Barclay at (661) 287-5702.

Letter No. A5
Tracey Jue, Director
Facilities Planning Bureau
Los Angeles Sheriff's Department
211 West Temple Street
Los Angeles, CA 90012

Response to Comment No. A5-1

The comment acknowledges the Los Angeles Sheriff's Department's (LASD) receipt of the Notice of Availability of the Draft EIR and briefly summarizes the Project description. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A5-2

Section 4.13, Public Services, of the Draft EIR, acknowledges that Project implementation would result in an increase in demand on existing LASD services due to the generation of an employee population on-site. However, the Project would not include residential uses and, thus, would not induce unplanned population growth in the Project area. In addition, the Project would include several design features and security measures that would reduce the opportunity for criminal activity to occur on-site. The Project would implement security fencing, security cameras monitored full-time at a manned security station on-site, licensed security personnel, and additional stage security throughout the Project Site. These security features would adhere to principles of Crime Prevention Through Environmental Design. Furthermore, Project development would require consultation with LASD prior to approval of building plans and permits.

As required by the County and the City's Law Enforcement Facilities Fee, the Project would be required to pay all applicable development and law enforcement mitigation fees prior to the issuance of a building or similar permit. The payment of such fees would ensure that LASD has sufficient funding for future personnel and assets.

With full compliance with all applicable local laws, as well as implementation of site-specific security features, the Project's contribution to impacts to LASD services would not be cumulatively considerable, and, as such, cumulative impacts would be less than significant.

Response to Comment No. A5-3

The City has the updated address and contact information on file. The City will continue to send notices related to the Project to Ms. Jue. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A5-4

As discussed in Response to Comment No. A5-2 above, the Project Applicant will consult with LASD prior to approval of building plans and permits to ensure that all special protection requirements or recommendations mentioned in the comment, including, but not limited to, landscaping maintenance, security cameras, and lighting, are incorporated into the Project design. In addition, the Project will be required to prepare a Construction Traffic Management Plan to ensure that construction activities will not impede emergency access. See also Response to Comment No. A5-4.

Response to Comment No. A5-5

The Project would install security cameras for a video monitoring system that can adequately identify vehicle license plates with adequate lighting to enhance visibility. Project lighting has been designed to provide sufficient lighting for the entire campus and the parking areas. The Project would also provide wayfinding signs, including, but not limited to, a street address number visible from Railroad Avenue and 13th Street and site directory to orient visitors and guests on-site.

Response to Comment No. A5-6

The Project's landscaping plan has been designed to minimize opportunities for hiding and limit the height of hedge-type plans where security gates are provided.

Response to Comment No. A5-7

The Project would provide wayfinding signs, including, but not limited to, a street address number visible from Railroad Avenue and 13th Street.

Dear Ms. Iverson:

DEIR Response to Shadowbox Studios Project

The Santa Clarita Valley Sanitation District (District) received a Draft Environmental Impact Report (DEIR) for the subject project on April 7, 2023. The proposed project is located within the jurisdictional boundaries of the District. Previous comments submitted by the District to your agency in correspondence dated April 22, 2022 (copy enclosed) still apply the subject project with the following comment: A6-1

- The expected average wastewater flow from Alternative 2 of the project, described in the DEIR as 199 apartment units, 775 attached dwelling units, and 50,000 square feet of commercial/mixed-use buildings, is 198,419 gallons per day. A6-2

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2743, or mandyhuffman@lacsd.org.

Very truly yours,

Mandy Huffman

April 22, 2022

Ref. DOC 6502038

Mr. Mike Marshall, Associate Planner
City of Santa Clarita
23920 Valencia Boulevard, Suite 302
Santa Clarita, CA 91355

Dear Mr. Marshall:

NOP Response to Blackhall Studios

The Santa Clarita Valley Sanitation District (District) received a Notice of Preparation of a Draft Environmental Impact Report for the subject project on March 31, 2022. The proposed project is located within the jurisdictional boundaries of the District. We offer the following comments regarding sewerage service:

1. A portion of the project area is outside the jurisdictional boundaries of the District and will require annexation into District before sewerage service can be provided to the proposed development. For a copy of the District's Annexation Information and Processing Fee sheets, go to www.lacsd.org, Wastewater & Sewer Systems, and click on Annexation Program. For more specific information regarding the annexation procedure and fees, please contact Ms. Donna Curry at (562) 908-4288, extension 2708. A6-3

2. The wastewater flow originating from the proposed project will discharge to a local sewer line, which is not maintained by the District, for conveyance to the District's San Fernando Road Trunk Sewer, located in a private right-of-way along the east side of San Fernando Road, south of Wiley Canyon Road. The District's 18-inch diameter trunk sewer has a capacity of 4.3 million gallons per day (mgd) and conveyed a peak flow of 0.1 mgd when last measured in 2018.

3. The District operates two water reclamation plants (WRPs), the Saugus WRP and the Valencia WRP, which provide wastewater treatment in the Santa Clarita Valley. These facilities are interconnected to form a regional treatment system known as the Santa Clarita Valley Joint Sewerage System (SCVJSS). The SCVJSS has a capacity of 28.1 mgd and currently processes an average flow of 19.6 mgd.

4. The expected average wastewater flow from the project, described in the NOP as approximately 473,000 square feet of sound stages; approximately 561,500 square feet of workshops, warehouses, and support uses; approximately 221,000 square feet of production and administrative offices; and approximately 37,500 square feet of catering and other specialty services, is 154,863 gallons per day. For a copy of the District's average wastewater generation factors, go to www.lacsd.org, under Services, then Wastewater Programs and Permits, select Will Serve Program, and scroll down to click on the Table 1, Loadings for Each Class of Land Use link.

5. The District is empowered by the California Health and Safety Code to charge a fee to connect facilities (directly or indirectly) to the District's Sewerage System or to increase the strength or quantity of wastewater discharged from connected facilities. This connection fee is used by the District for its capital facilities. Payment of a connection fee may be required before this project is permitted to discharge to the District's Sewerage System. For more information and a copy of the Connection Fee Information Sheet, go

LETTER A6 Continued

to www.lacsd.org, under Services, then Wastewater (Sewage) and select Rates & Fees. In determining the impact to the Sewerage System and applicable connection fees, the District will determine the user category (e.g. Condominium, Single Family Home, etc.) that best represents the actual or anticipated use of the parcel(s) or facilities on the parcel(s) in the development. For more specific information regarding the connection fee application procedure and fees, the developer should contact the District's Wastewater Fee Public Counter at (562) 908-4288, extension 2727.

6. In order for the District to conform to the requirements of the Federal Clean Air Act (CAA), the capacities of the District's wastewater treatment facilities are based on the regional growth forecast adopted by the Southern California Association of Governments (SCAG). Specific policies included in the development of the SCAG regional growth forecast are incorporated into clean air plans, which are prepared by the South Coast and Antelope Valley Air Quality Management Districts in order to improve air quality in the South Coast and Mojave Desert Air Basins as mandated by the CAA. All expansions of District's facilities must be sized and service phased in a manner that will be consistent with the SCAG regional growth forecast for the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial. The available capacity of the District's treatment facilities will, therefore, be limited to levels associated with the approved growth identified by SCAG. As such, this letter does not constitute a guarantee of wastewater service, but is to advise the developer that the District intends to provide this service up to the levels that are legally permitted and to inform the developer of the currently existing capacity and any proposed expansion of District's facilities.

A6-3 Continued

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2743, or mandyhuffman@lacsd.org.

Very truly yours,

Letter No. A6

Mandy Huffman, Environmental Planner
Facilities Planning Department
Los Angeles County Sanitation Districts
1955 Workman Mill Road
Whittier, CA 90601

Response to Comment No. A6-1

The comment acknowledges receipt of the Draft EIR for the Project and refers to specific comments from the Santa Clarita Valley Sanitation District (District) regarding sewerage service that were submitted in response to the Notice of Preparation dated April 22, 2022. This NOP response from the District was included in Appendix A of the Draft EIR.

Response to Comment No. A6-2

The comment updates the information presented in Section 5.0, Alternatives, of the Draft EIR, as follows:

- The second sentence in the last paragraph on page 5.0-22 was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

> ~~As with the Project,~~ Based on the information provided by the LACSD, the amount of wastewater generated by Alternative 2 is ~~based on the water demand identified above, which is equal to 0.32 million~~ 198,419 gallons per day (gpd). The water demand and the solid waste and wastewater generation are ~~substantially~~ greater than those identified for the Project (i.e., 207 AFY of water, ~~0.19 mgd~~ 186,301 gpd of wastewater, and 2,900 pounds of solid waste).

These revisions do not result in the Project creating any new or increased significant environmental impact that was not already identified in the Draft EIR.

Response to Comment No. A6-3

The information previously submitted by the District was reviewed, considered, and incorporated into the Draft EIR as pertinent under CEQA. As presented in response to Response to Comment No. A6-2, the wastewater generation under Alternative 2 has been updated. This update does not result in the Project or Alternative 2 creating any new or increased significant environmental impact that was not already identified in the Draft EIR.

The Project would be required to pay a fee to connect to the local sewer network. The City would not issue connection permits to the sewer system if it cannot be demonstrated that sufficient capacity exists to serve the Project.

The comment regarding the District's conformance to the requirements of the Federal Clean Air Act does not pertain to the Draft EIR. The comment is primarily made to inform the Project applicant that the District intends to provide sewerage service up to the levels that are legally permitted based on existing capacity and any proposed expansion of District facilities. The comment is noted for the administrative record and forwarded to the decision-makers for consideration.

RE: Shadowbox Studios Project (Master Case 21-109)
Notice of Availability of Environmental Impact Report (EIR)

Dear Ms. Iverson:

Thank you for coordinating with the Los Angeles County Metropolitan Transportation Authority (Metro) regarding the proposed Shadowbox Studios Project (Project) located in the City of Santa Clarita (City). Metro is committed to working with local municipalities, developers, and other stakeholders across Los Angeles County on transit-supportive developments to grow ridership, reduce driving, and promote walkable neighborhoods. Transit Oriented Communities (TOCs) are places (such as corridors or neighborhoods) that, by their design, allow people to drive less and access transit more. TOCs maximize equitable access to a multi-modal transit network as a key organizing principle of land use planning and holistic community development.

The purpose of this letter is to briefly describe the Project based on the Notice of Availability for the Environmental Impact Report (EIR) and outline recommended topics of study and project design features for the EIR concerning issues that are germane to our agency's statutory responsibility in relation to the Metro-owned right-of-way (ROW), which may be affected by the proposed Project.

A7-1

In addition to the specific comments outlined below, Metro is providing the City and Applicant with the Metro Adjacent Development Handbook (attached), which provides an overview of common concerns for development adjacent to Metro-owned right-of-way (ROW) and transit facilities, available at https://www.metro.net/devreview.

Project Description
The Project includes construction of 19 sound stages, a three-story office building, and a four-story, 1,072 space parking structure with four aboveground levels proposed at the northeastern corner of Railroad Avenue and 13th Street. Additionally, the project is conditioned to construct a Class I multi-purpose path along the frontage on 12th, Arch, and 13th Streets. Modifications to the Dockweiler Drive Extension Project are also proposed. Modifications include widening the railroad crossing at Arch Street and 13th Street, 13th Steet and constructing a pedestrian and bike bridge from the Jan Heidt Newhall Metrolink Station on Railroad Avenue to the future extension of Dockweiler Drive.

Recommendations for EIR Scope and Content

Responsible Agency Status

Per Section 15381 of the CEQA Guidelines (14 Cal. Code of Regulations, div. 6, ch. 3), a "Responsible Agency" is "a public agency which proposes to carry out or approve a project, for which a Lead Agency is preparing or has prepared an EIR or Negative Declaration. For the purposes of CEQA, the term 'Responsible Agency' includes all public agencies other than the Lead Agency which have discretionary approval power over the project." Metro may need to approve permits, clearances, or agreements necessary to carry out portions of the Project, in particular for the bike path and other off-site improvements located within Metro's property. Therefore, Metro anticipates that we will be a Responsible Agency for the purposes of the preparation of this EIR and may rely on the EIR for its future approvals. A7-2

On page ES-5 and 2.0-25: Recommend including Los Angeles County Metropolitan Transportation Authority (Metro) as a listed agency for permits approval, as Metro would need to review and approve a license agreement for the proposed Class I Bike Trail along Railroad Avenue and the 13th Street crossing improvements.

Metrolink Adjacency

1. Operations: The Project site is adjacent to Metro-owned ROW operated and maintained by the Southern California Regional Rail Authority (SCRRA) to run the Metrolink commuter rail service. The Applicant is advised that rail service operates in both directions and that trains may operate 24 hours a day, seven days a week, in the ROW adjacent to the Project. A7-3

2. Impact Analysis: Due to the Project's proximity to Metrolink ROW and the proposed Class I Bike Trail within the ROW, the EIR must analyze potential effects on rail operations and identify mitigation measures as appropriate. Critical impacts to be studied should include (without limitation): impacts of Project construction and operation on and potential damage to the structural and systems integrity of tracks and related infrastructure; disruption to rail service; potential limitations to expansion of rail service as a result of the proposed Class I bike Trail and rail crossing safety for pedestrians and vehicles. Specific impacts and mitigation measures that should be studied include: A7-4

    a. Structure Setback: Structures that are immediately adjacent to the railroad ROW can pose safety hazards and may disrupt transit service and/or damage Metrolink infrastructure. Such conflicts can occur during Project construction and/or operation. The Applicant will generally not be permitted to access Metrolink ROW to maintain private development. A7-5

    b. Class I Bike Trail: The Class I Bike Trail proposed within the ROW can pose impacts to Metrolink service operations and create limitations to expansion of rail service. The Class I Bike Trail's impact to Metrolink service should be analyzed. A7-6

    Recommended mitigation measure:

        i. Technical Review: The Applicant shall submit engineering drawings and calculations, as well as construction work plans and methods including any crane placement and radius, to evaluate any impacts to the Antelope Valley Line infrastructure in relationship to the Project. Before issuance of any building permit for the Project, the Applicant shall obtain SCRRA's approval of final construction drawings. A7-7

        ii. Setback: Where the Project property is immediately adjacent to Metrolink ROW (owned by Metro), all Project structures shall be set back five a minimum of five (5) feet from property line to allow adequate space for property maintenance.

        iii. Access: Any access to railroad property is strictly at the discretion of Metro and SCRRA. The Applicant shall obtain specific Right-of-Entry temporary access permits from SCRRA for any work performed on the Project's structures or property requiring

access to the railroad ROW. Where feasible, the Applicant shall maintain fencing and walls at or near property lines from the private property side.

iv. Construction Monitoring: The Applicant shall permit Metro and/or SCRRA staff to monitor construction activity to ascertain any impact to the ROW. During construction, the Applicant shall construct a protection barrier to prevent objects, material, or debris from falling onto the ROW. The Applicant shall notify Metro and SCRRA of any changes to the construction/building plans that may or may not impact the ROW.

A7-7 Continued

c. At-Grade Crossings: There is an at-grade rail crossing in close proximity to the Project at the intersection of 13th Street and Railroad Avenue. The Project is likely to increase traffic volumes across this at-grade crossing, which could potentially impact the safety of the crossing. As such, these traffic and safety impacts should be analyzed. This rail crossing is regulated by the California Public Utilities Commission (CPUC). CPUC may have additional comments and requirements regarding this Project and should be contacted in consultation efforts.

Recommended mitigation measure: The Applicant shall analyze traffic and safety impacts and comply with all regulations and requirements of the CPUC with respect to the Project's potential impacts on the at-grade rail crossing at the intersection of 13th Street and Railroad Avenue.

Additionally, a new field diagnostic meeting with Metro/SCRRA is required to assess impacts to the nearest railroad at-grade crossings.

A7-8

3. Advisories to Applicant: The Applicant is encouraged to contact Metro Development Review Team and Metrolink staff early in the design process to plan for potential impacts. The Applicant should also be advised of the following:

a. Occupational Safety and Health Administration (OSHA) Requirements: Demolition, construction and/or excavation work in proximity to Metro-owned ROW with potential to damage subway tracks and related infrastructure may be subject to additional OSHA safety requirements.

b. Technical Review: Metro/SCRRA charges for staff time spent on engineering review and construction monitoring.

c. Cost of Impacts: The Applicant will be responsible for costs incurred by Metro or SCRRA resulting from Project construction/operation issues that cause delay or harm to Metrolink service delivery or infrastructure, including single-tracking or bus bridging around closures. The Applicant will also bear all costs for any noise mitigation required for the Project.

A7-9

Transit Supportive Planning: Recommendations and Resources

Considering the Project's proximity to the Jan Heidt Newhall Metrolink Station, Metro would like to identify the potential synergies associated with transit-oriented development:

1. Transit Supportive Planning Toolkit: Metro strongly recommends that the Applicant review the Transit Supportive Planning Toolkit which identifies 10 elements of transit-supportive places and, applied collectively, has been shown to reduce vehicle miles traveled by establishing community-scaled density, diverse land use mix, combination of affordable housing, and infrastructure projects for pedestrians, bicyclists, and people of all ages and abilities. This resource is available at https://www.metro.net/about/funding-resources/.

A7-10

2. Transit Connections and Access: Metro strongly encourages the Applicant to install Project features that help facilitate safe and convenient connections for pedestrians, people riding bicycles, and transit users to/from the Project site and nearby destinations. The City should consider requiring the installation of such features as part of the conditions of approval for the Project, including:

    a. Walkability: The provision of wide sidewalks, pedestrian lighting, a continuous canopy of shade trees, enhanced crosswalks with ADA-compliant curb ramps, and other amenities along all public street frontages of the development site to improve pedestrian safety and comfort to access the nearby Metrolink Station.

    b. Bicycle Use and Micromobility Devices: The provision of adequate short-term bicycle parking, such as ground-level bicycle racks, and secure, access-controlled, enclosed long-term bicycle parking for residents, employees, and guests. Bicycle parking facilities should be designed with best practices in mind, including highly visible siting, effective surveillance, ease to locate, and equipment installation with preferred spacing dimensions, so bicycle parking can be safely and conveniently accessed. Similar provisions for micro-mobility devices are also encouraged. The

    c. First & Last Mile Access: The Project should address first-last mile connections to transit and is encouraged to support these connections with wayfinding signage inclusive of all modes of transportation. For reference, please review the First Last Mile Strategic Plan, authored by Metro and the Southern California Association of Governments (SCAG), available on-line at: http://media.metro.net/docs/sustainability_path_design_guidelines.pdf

A7-11

3. Parking: Metro encourages the incorporation of transit-oriented, pedestrian-oriented parking provision strategies such as the reduction or removal of minimum parking requirements and the exploration of shared parking opportunities. These strategies could be pursued to reduce automobile-orientation in design and travel demand.

A7-12

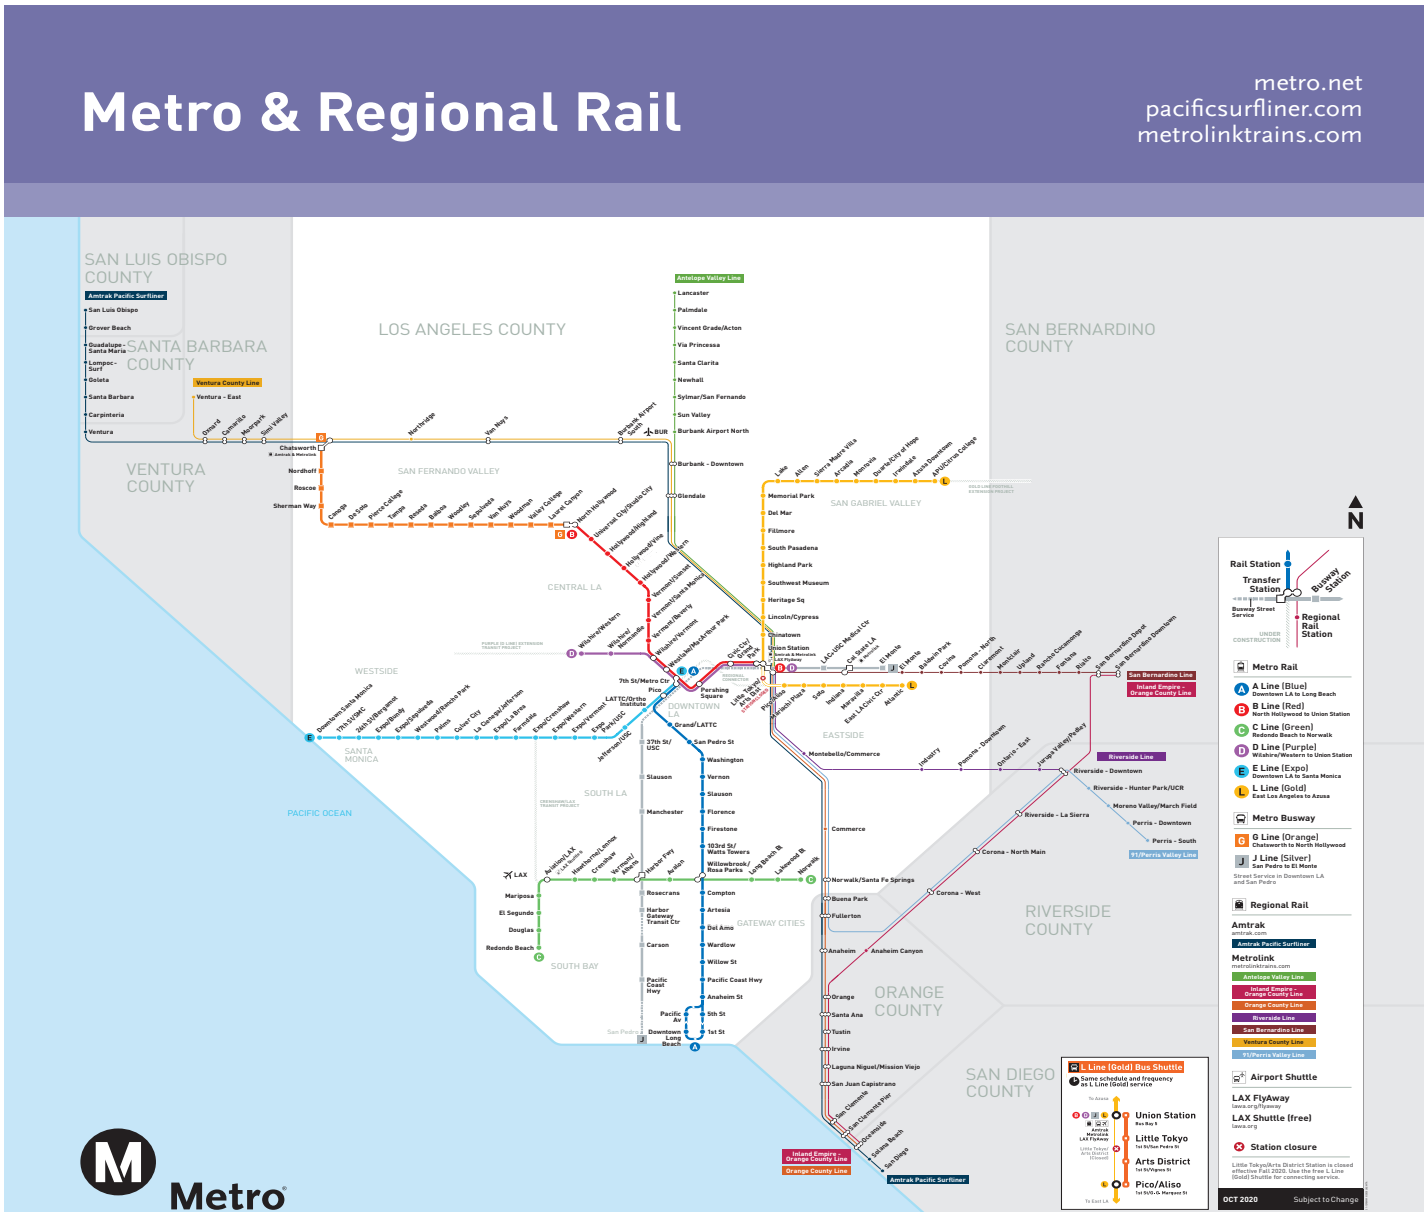
METRO ADJACENT DEVELOPMENT HANDBOOK

A GUIDE FOR CITIES AND DEVELOPERS

February 2021

Metro and Regional Rail Map



Metro is currently undertaking the largest rail infrastructure expansion effort in the United States. A growing transit network presents new opportunities to catalyze land use investment and shape livable communities.

Table of Contents

Quick Overview

Purpose of Handbook

The Metro Adjacent Development Handbook (Handbook) is intended to provide information and guide coordination for projects adjacent to, below, or above Metro transit facilities (e.g. right-of-way, stations, bus stops) and services.

Overarching Goal
By providing information and encouraging early coordination, Metro seeks to reduce potential conflicts with transit services and facilities, and identify potential synergies to expand mobility and improve access to transit.

Intended Audience
The Handbook is a resource for multiple stakeholder groups engaged in the development process, including:

- Local jurisdictions who review, entitle, and permit development projects,
- Developers,
- Property owners,
- Architects, engineers, and other technical consultants,
- Builders/contractors,
- Utility companies, and
- other Third Parties.

Handbook Content
The Handbook includes:

- **Introduction** of Metro's Development Review coordination process, common concerns, and typical stages of review.
- **Information** on best practices during three key coordination phases to avoid potential conflicts or create compatibility with the Metro transit system:
  - Planning & Conceptual Design,
  - Engineering & Technical Review, and
  - Construction Safety & Monitoring.
- **Glossary** with definitions for key terms used throughout the Handbook.

RULE OF THUMB: 100 FEET

Metro's Development Review process applies to projects that are within 100 feet of Metro transit facilities.

While the Handbook summarizes key concerns and best practices for adjacency conditions, it does not replace Metro's technical requirements and standards.

Prior to receiving approval for any construction activities adjacent to, above, or below Metro facilities, Third Parties must comply with the Metro Adjacent Construction Design Manual, available on Metro's website.

Contact Us
For questions, contact the Development Review Team:

- Email: devreview@metro.net
- Phone: 213.418.3484
- Online In-take Form: https://jpropublic.metro.net/in-take-form

Additional Information & Resources

- Metro Development & Construction Coordination website: https://www.metro.net/devreview
- Metro GIS/KML ROW Files: https://developer.metro.net/portfolio-item/metro-right-of-way-gis-data
- Metrolink Standards and Procedures: https://www.metrolinktrains.com/about/agency/engineering--construction

Metro will continue to revise the Handbook, as needed, to reflect updates to best practices in safety, operations, and transit-supportive development.

Background

Who is Metro?

The Los Angeles County Metropolitan Transportation Authority (Metro) plans, funds, builds, and operates rail, bus, and other mobility services (e.g. bikeshare, microtransit) throughout Los Angeles County (LA County). On average, Metro moves 1.3 million people each day on buses and trains. With funding from the passage of Measure R (2008) and Measure M (2016), the Metro system is expanding. Over the next 40 years, Metro will build over 60 new stations and over 100 miles of transit right-of-way (ROW). New and expanded transit lines will improve mobility across LA County, connecting riders to more destinations and expanding opportunities for development that supports transit ridership. Metro facilities include:

Metro Rail: Metro operates heavy rail (HRT) and light rail (LRT) transit lines in underground tunnels, along streets, off-street in dedicated ROW, and above street level on elevated structures. Heavy rail trains are powered by a "third rail" along the tracks. Light rail vehicles are powered by overhead catenary systems (OCS). To support rail operations, Metro owns and maintains traction power substations (TPSS), maintenance yards, and other infrastructure.

Metrolink/Regional Rail: Metro owns a majority of the ROW within LA County on which the Southern California Regional Rail Authority (SCRRA) operates Metrolink service. Metrolink is a commuter rail system with seven lines that span 388 miles across five counties, including: Los Angeles, Orange, Riverside, San Bernardino, Ventura, and North San Diego. As a SCRRA member agency and property owner, Metro reviews development activity adjacent to Metro-owned ROW on which Metrolink operates, and coordinates with Metrolink on any comments or concerns. Metrolink has its own set of standards and processes, see link on page 1.

Metro Bus Rapid Transit (BRT): Metro operates accelerated bus transit, which acts as a hybrid between rail and traditional bus service. Metro BRT may operate in a dedicated travel lane within a street or freeway, or off-street along dedicated ROW. Metro BRT stations may be located on sidewalks within the public right-of-way, along a median in the center of streets, or off-street on Metro-owned property.

Metro Bus: Metro operates 170 bus lines across more than 1,400 square miles in LA County. The fleet serves over 15,000 bus stops with approximately 2,000 buses. Metro operates "Local" and "Rapid" bus service within the street, typically alongside vehicular traffic, though occasionally in "bus-only" lanes. Metro bus stops are typically located on sidewalks within the public right-of-way, which is owned and maintained by local jurisdictions. Metro's NextGen Bus Plan re-envisions bus service across LA County to make service improvements that better serve riders.

Why is Metro interested in adjacent development?

Metro Supports Transit Oriented Communities: Metro is redefining the role of the transit agency by expanding mobility options, promoting sustainable urban design, and helping transform communities throughout LA County. Metro seeks to partner with local, state, and federal jurisdictions, developers, property owners and other stakeholders across LA County on transit-supportive planning and developments to grow ridership, reduce driving, and promote walkable neighborhoods. Transit Oriented Communities (TOCs) are places (such as corridors or neighborhoods) that, by their design, allow people to drive less and access transit more. TOCs maximize equitable access to a multi-modal transit network as a key organizing principle of land use planning and holistic community development.

Adjacent Development Leads to Transit Oriented Communities: Metro supports private development adjacent to transit as this presents a mutually beneficial opportunity to enrich the built environment and expand mobility options. By connecting communities, destinations, and amenities through improved access to public transit, adjacent developments have the potential to:

- reduce auto dependency,
- reduce greenhouse gas emissions,
- promote walkable and bikeable communities that accommodate more healthy and active lifestyles,
- improve access to jobs and economic opportunities, and
- create more opportunities for mobility – highly desirable features in an increasingly urbanized environment.

Opportunity: Acknowledging an unprecedented opportunity to influence how the built environment develops along and around transit and its facilities, Metro has created this document. The Handbook helps ensure compatibility between private development and Metro's transit infrastructure to minimize operational, safety, and maintenance issues. It serves as a crucial first step to encourage early and active collaboration with local stakeholders and identify potential partnerships that leverage Metro initiatives and support TOCs across LA County.

Metro Purview & Concerns

Metro Purview for Review & Coordination

Metro is interested in reviewing development, construction, and utility projects within 100 feet of Metro transit facilities, real estate assets, and ROW – as measured from the edge of the ROW outward – both to ensure the structural safety of existing or planned transit infrastructure and to maximize integration opportunities with adjacent development. The Handbook seeks to:

- Improve communication and coordination between developers, jurisdictions, and Metro.
- Identify common concerns associated with developments adjacent to Metro ROW.
- Highlight Metro operational needs and requirements to ensure safe, continuous service.
- Prevent potential impacts to Metro transit service or infrastructure.
- Maintain access to Metro facilities for riders and operational staff.
- Avoid preventable conflicts resulting in increased development costs, construction delays, and safety impacts.
- Streamline the review process to be transparent, clear, and efficient.
- Assist in the creation of overall marketable and desirable developments.

Key Audiences for Handbook

The Handbook is intended to be used by:

- Local jurisdictions who review, entitle, and permit development projects and/or develop policies related to land use, development standards, and mobility,
- Developers, property owners,
- Architects, engineers, design consultants,
- Builders/contractors,
- Entitlement consultants,
- Environmental consultants,
- Utility companies, and
- other Third Parties.

Metro Assets & Common Concerns for Adjacent Development

The table on the facing page outlines common concerns for development projects and/or construction activities adjacent to Metro transit facilities and assets. These concerns are discussed in greater detail in the following chapters of the Handbook.

METRO ASSETS	COMMON ADJACENCY CONCERNS
 **UNDERGROUND ROW** Transit operates below ground in tunnels.	• Excavation near tunnels and infrastructure • Clearance from support structures (e.g. tiebacks, shoring, etc) • Coordination with utilities • Clearance from ventilation shafts, surface penetrations (e.g. emergency exits) • Surcharge loading of adjacent construction • Explosions • Noise and vibration/ground movement • Storm water drainage
 **AERIAL ROW** Transit operates on elevated guideway, typically supported by columns.	• Excavation near columns and support structures • Column foundations • Clearance from OCS • Overhead protection and crane swings • Setbacks from property line for maintenance activities to occur without entering ROW • Coordination with utilities • Noise reduction (e.g. double-paned windows)
 **AT-GRADE ROW** Transit operates in dedicated ROW at street level; in some cases tracks are separated from adjacent property by fence or wall.	• Pedestrian and bicycle movements and safety • Operator site distance/cone of visibility • Clearance from OCS • Crane swings and overhead protection • Trackbed stability • Storm water drainage • Noise/vibration • Driveways near rail crossings • Setbacks from property line for maintenance activities to occur without entering ROW • Utility coordination
 **BUS STOPS** Metro operates bus service on city streets. Bus stops are located on public sidewalks.	• Lane closures and re-routing service during construction • Temporary relocation of bus stops • Impacts to access to bus stops
 **NON-REVENUE/OPERATIONAL** Metro owns and maintains property to support operations (e.g. bus and rail maintenance facilities, transit plazas, traction power substations, park-and-ride parking lots).	• Excavation and clearance from support structures (e.g. tiebacks, shoring, etc) • Ground movement • Drainage • Utility coordination • Access to property

Metro Coordination Process

Typical Stages of Metro Review and Coordination

Early coordination helps avoid conflicts between construction activities and transit operations and maximizes opportunities to identify synergies between the development project and Metro transit services that are mutually beneficial.

*Phases above may include fees for permits and reimbursement of Metro staff time for review and coordination.

Coordination Goal: Metro encourages developers to consult with the Development Review Team early in the design process to ensure compatibility with transit infrastructure and minimize operational, safety, and maintenance issues with adjacent development. The Development Review team will serve as a case manager to developers and other Third Parties to facilitate the review of plans and construction documents across key Metro departments.

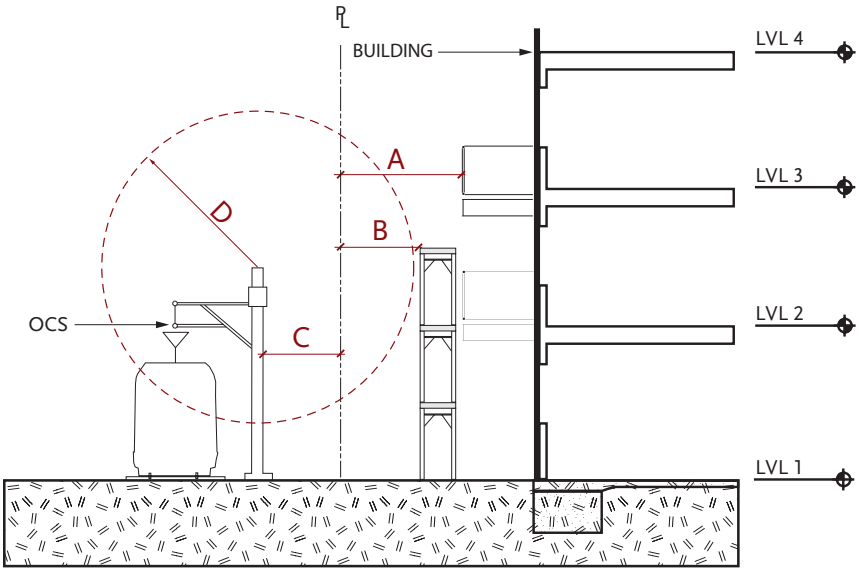
Level of Review: Not all adjacent projects will require significant review and coordination with Metro. The level of review depends on the Project's proximity to Metro, adjacency conditions, and the potential to impact Metro facilities and/or services. For example, development projects that are excavating near Metro ROW or using cranes near transit facilities require a greater level of review and coordination. Where technical review and construction monitoring is needed, Metro charges fees for staff time, as indicated by asterisk in the above diagram.

Permit Clearance: Within the City of Los Angeles, Metro reviews and clears Building & Safety permits for projects within 100 feet of Metro ROW, pursuant to Zoning Information 1117. To ensure timely clearance of these permits, Metro encourages early coordination as noted above.

To begin consultation, submit project information via an online In-Take Form, found on Metro's website. Metro staff will review project information and drawings to screen the project for any potential impacts to transit facilities or services, and determine if require further review and coordination is required. The sample sections on the facing page illustrate adjacency condition information that helps Metro complete project screening.

Contact:
Metro Development Review Team
Website: https://www.metro.net/devreview
Online In-take Form: https://jpropublic.metro.net/in-take-form
Email: devreview@metro.net
Phone: 213.418.3484

Sample Section: Adjacency Conditions



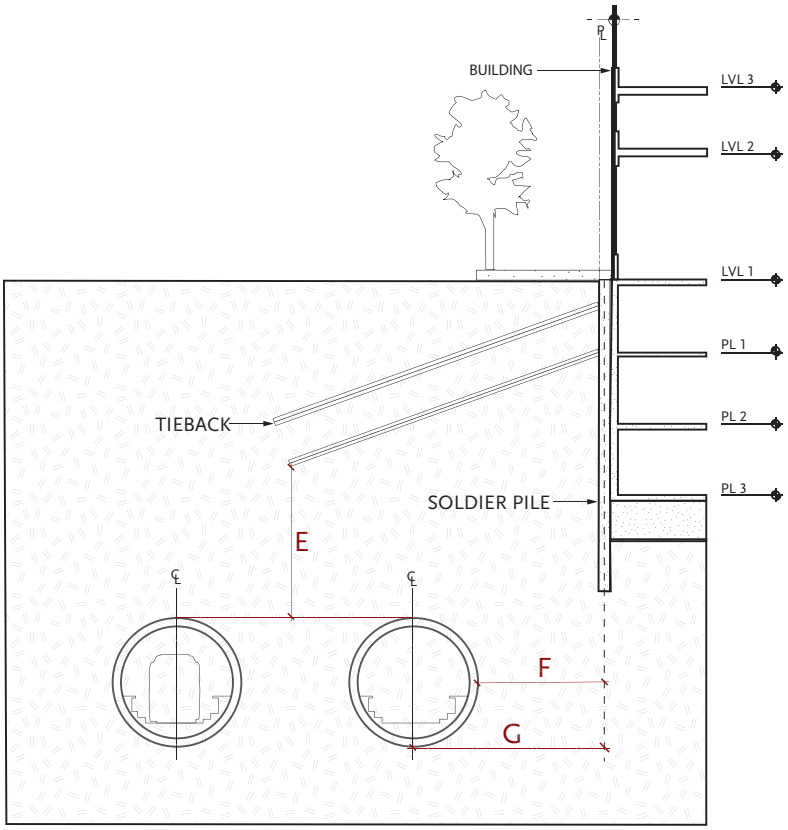
AT-GRADE CONDITION

A. Distance from property line to nearest permanent structure (e.g. building facade, balconies, terraces). Refer to Section 1.3 Building Setback of Handbook.

B. Distance from property line to nearest temporary construction structures (e.g. scaffolding).

C. Distance from property line to nearest Metro facility.

D. Clearance from nearest temporary and/or permanent structure to overhead catenary system (OCS). Refer to Section 1.4, OCS Clearance of Handbook.



BELOW-GRADE CONDITION

E. Vertical distance from top of Metro tunnel to closest temporary and/or permanent structure (e.g. tiebacks, foundation). Refer to Section 2.2, Proximity to Tunnels & Underground Infrastructure of Handbook.

F. Horizontal distance from exterior tunnel wall to nearest structure.

G. Horizontal distance from Metro track centerline to nearest structure.

Best Practices

Best Practices for Developer Coordination

Metro encourages developers of projects adjacent to Metro ROW and/or Real Estate Assets to take the following steps to facilitate Metro project review and approval:

1. **Review Metro resources and policies:** The Metro Development & Construction Coordination website and Handbook provide important information for those interested in constructing on, adjacent, over, or under Metro ROW, non-revenue property, or transit facilities. Developers and other Third Parties should familiarize themselves with these resources and keep in mind common adjacency concerns when planning a project.

2. **Contact Metro early during design process:** Metro welcomes the opportunity to provide feedback early in project design, allowing for detection and resolution of important adjacency issues, identification of urban design and system integration opportunities, and facilitation of permit approval. Metro encourages project submittal through the online In-Take Form to begin consultation.

3. **Maintain communication:** Frequent communication with Metro during project design and construction will reinforce relationships and allow for timely project completion. Contact us at devreview@metro.net or at 213.418.3484.

Best Practices for Local Jurisdiction Notification

To improve communication between Metro and the development community, Metro suggests that local jurisdictions take the following steps to notify property owners of coordination needs for properties adjacent to Metro ROW by:

- **Updating GIS and parcel data:** Integrate Metro ROW files into the City/County GIS and/or Google Earth Files for key departments (e.g. Planning, Public Works, Building & Safety) to notify staff of Metro adjacency and need for coordination during development approval process.Download Metro's ROW files here.

- **Flag Parcels:** Create an overlay zone as part of local Specific Plan(s) and/or Zoning Ordinance(s) to tag parcels that are within 100 feet Metro ROW and require coordination with Metro early during the development process [e.g. City of Los Angeles Zone Information and Map Access System (ZI-1117)].

- **Provide Resources:** Direct all property owners and developers interested in parcels within 100 feet of Metro ROW to Metro's resources (e.g. website, Handbook).

Monica
E

Site Plan & Conceptual Design

Site Plan & Conceptual Design

1.1 Supporting Transit Oriented Communities

Transit-oriented communities (TOCs) are places that, by their design, make it more convenient to take transit, walk, bike or roll than to drive. By working closely with the development community and local jurisdictions, Metro seeks to ensure safe construction near Metro facilities and improve compatibility with adjacent development to increase transit ridership.

RECOMMENDATION: Consider site planning and building design strategies to that support transit ridership, such as:

- Leveraging planning policies and development incentives to design a more compelling project that capitalizes on transit adjacency and economy of scales.
- Programming a mix of uses to create lively, vibrant places that are active day and night.
- Utilizing Metro policies and programs that support a healthy, sustainable, and welcoming environment around transit service and facilities.
- Prioritizing pedestrian-scaled elements to create spaces that are comfortable, safe, and enjoyable.
- Activating ground floor with retail and outdoor seating/activities to bring life to the public environment.
- Reducing and screening parking to focus on pedestrian activity.
- Incorporating environmental design elements that help reduce crime (e.g. windows and doors that face public spaces, lighting).

The Wilshire/Vermont Metro Joint Development project leveraged existing transit infrastructure to catalyze a dynamic and accessible urban environment. This project accommodates portal access into the Metro Rail system and on-street bus facilities.

1.2 Enhancing Access to Transit

Metro seeks to create a comprehensive, integrated transportation network and supports infrastructure and design that allows safe and convenient access to its multi-modal services. Projects in close proximity to Metro's services and facilities present an opportunity to enhance the public realm and connections to/from these services for transit riders as well as users of the developments.

RECOMMENDATION: Design projects with transit access in mind. Project teams should capitalize on the opportunity to improve the built environment and enhance the public realm for pedestrians, bicyclists, persons with disabilities, seniors, children, and users of green modes. Metro recommends that projects:

- Orient major entrances to transit service, making access and travel safe, intuitive, and convenient.
- Plan for a continuous canopy of shade trees along all public right-of-way frontages to improve pedestrian comfort to transit facilities.
- Add pedestrian lighting along paths to transit facilities and nearby destinations.
- Integrate wayfinding and signage into project design.
- Enhance nearby crosswalks and ramps.
- Ensure new walkways and sidewalks are clear of any obstructions, including utilities, traffic control devices, trees, and furniture.
- Design for seamless, multi-modal pedestrian connections, making access easy, direct, and comfortable.

The City of Santa Monica leveraged investments in rail transit and reconfigured Colorado Avenue to form a multi-modal first/last mile gateway to the waterfront from the Downtown Santa Monica Station. Photo by PWP Landscape Architecture

1.3 Building Setback

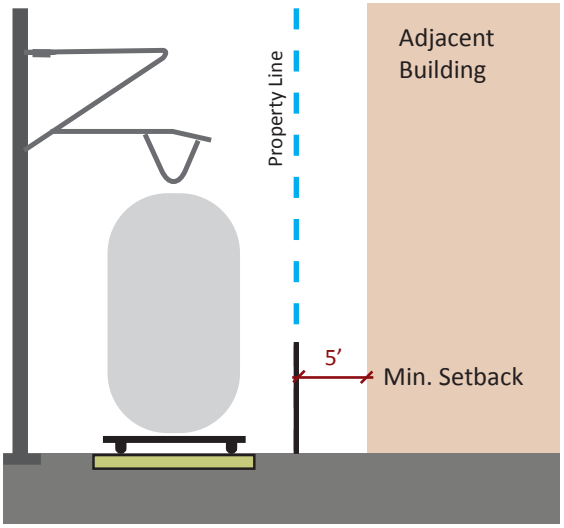
Buildings and structures with a zero lot setback that closely abut Metro ROW can pose concerns to Metro during construction. Encroachment onto Metro property to construct or maintain buildings is strongly discouraged as this presents safety hazards and may disrupt transit service and/or damage Metro infrastructure.

RECOMMENDATION: Include a minimum setback of five (5) feet from the property line to building facade to accommodate the construction and maintenance of structures without the need to encroach upon Metro property. As local jurisdictions also have building setback requirements, new developments should comply with the greater of the two requirements.

Entry into the ROW by parties other than Metro and its affiliated partners requires written approval. Should construction or maintenance of a development necessitate temporary or ongoing access to Metro ROW, a Metro Right of Entry Permit must be requested and obtained from Metro Real Estate for every instance access is required. Permission to enter the ROW is granted solely at Metro's discretion.

Coordination between property owners of fences, walls, and other barriers along property line is recommended. See Section 1.5.

Refer to Section 3.2 – Track Access and Safety for additional information pertaining to ROW access in preparation for construction activities.



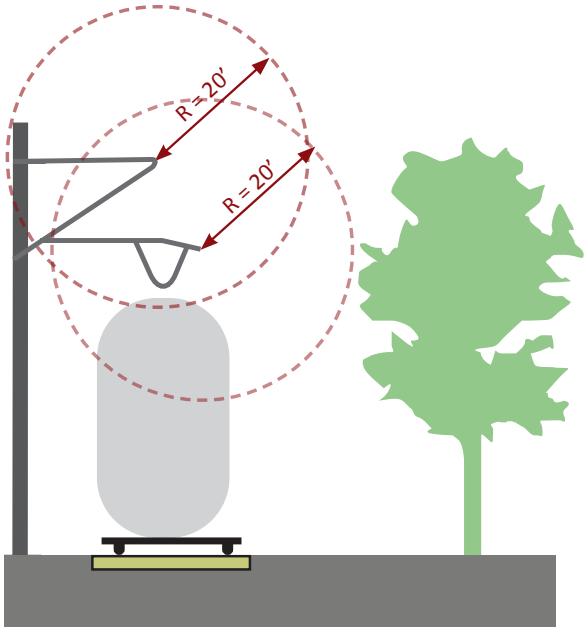
A minimum setback of five (5) feet between an adjacent structure and Metro ROW is strongly encouraged to allow project construction and ongoing maintenance without encroaching on Metro property.

1.4 Overhead Catenary System (OCS) Clearance

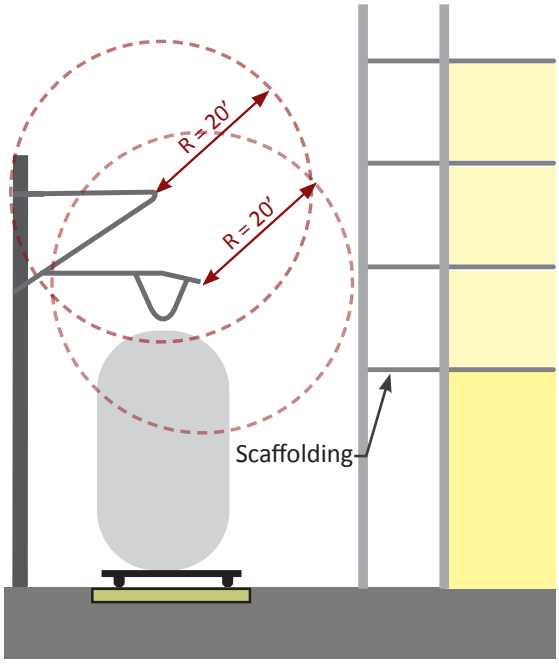
Landscaping and tree canopies can grow into the OCS above light rail lines, creating electrical safety hazards as well as visual and physical impediments for trains. Building appurtenances facing rail ROW, such as balconies, may also pose safety concerns to Metro operations as objects could fall onto the OCS.

RECOMMENDATION: Design project elements facing the ROW to avoid potential conflicts with Metro transit vehicles and infrastructure. Metro recommends that projects:

- Plan for landscape maintenance from private property and prevent growth into Metro ROW. Property owners will not be permitted to access Metro property to maintain private development.
- Design buildings such that balconies do not provide building users direct access to Metro ROW.
- Maintain building appurtenances and landscaping at a minimum distance of ten (10) feet from the OCS and support structures. If Transmission Power (TP) feeder cable is present, twenty (20) feet from the OCS and support structures is required. Different standards will apply for Metro Trolley Wires, Feeder Cables (wires) and Span Wires.



Adjacent structures and landscaping should be sited and maintained to avoid conflicts with the rail OCS.



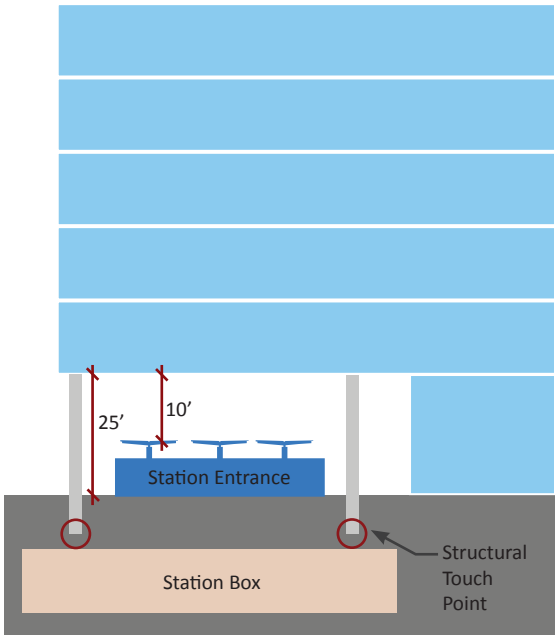
Scaffolding and construction equipment should be staged to avoid conflicts with the rail OCS.

1.5 Underground Station Portal Clearance

Metro encourages transit-oriented development. Where development is planned above station entrances, close coordination is needed for structural safety as well as access for patrons, operations, and maintenance. Below are key design rules of thumb for development planned to cantilever over an entrance to an underground Metro Rail station.

RECOMMENDATION:

1. Preserve 25 feet clearance at minimum from plaza grade and the building structure above.
2. Preserve 10 feet clearance at minimum between portal roof and building structure above.
3. Coordinate structural support system and touchdown points to ensure a safe transfer of the building loads above the station portal.
4. Coordinate placement of structural columns and amenities (e.g. signage, lighting, furnishings) at plaza level to facilitate direct and safe connections for people of all mobile abilities to and from station entrance(s).
5. Develop a maintenance plan for the plaza in coordination with Metro.



Projects that propose to cantilever over Metro subway portals require close coordination with Metro Engineering.

1.6 Shared Barrier Construction & Maintenance

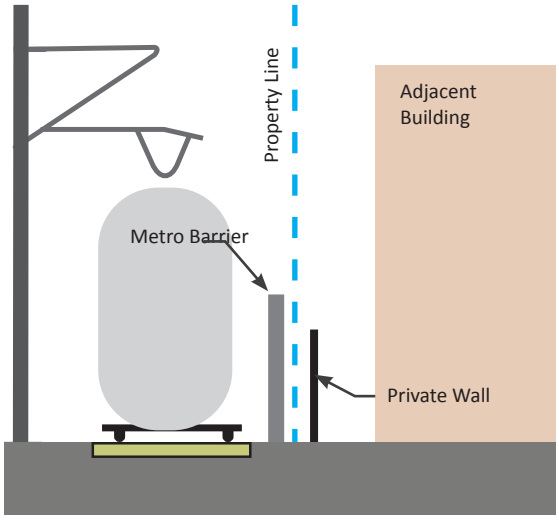
In areas where Metro ROW abuts private property, barrier construction and maintenance responsibilities can be a point of contention with property owners. When double barriers are constructed, the gap created between the Metro-constructed fence and a private property owner's fence can accumulate trash and make regular maintenance challenging without accessing the other party's property.

RECOMMENDATION: Coordinate with Metro Real Estate to create a single barrier condition along the ROW property line. With an understanding that existing conditions along ROW boundaries vary throughout LA County, Metro recommends the following, in order of preference:

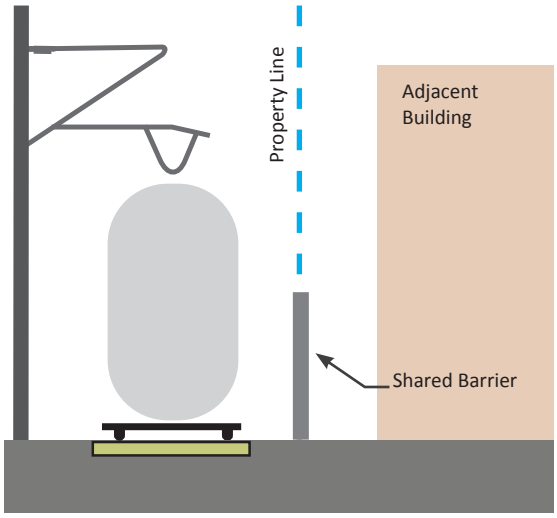
- **Enhance existing Metro barrier:** if structural capacity allows, private property owners and developers should consider physically affixing improvements onto and building upon Metro's existing barrier. Metro is amenable to barrier enhancements such as increasing barrier height and allowing private property owners to apply architectural finishes to their side of Metro's barrier.

- **Replace existing barrier(s):** if conditions are not desirable, remove and replace any existing barrier(s), including Metro's, with a new single "shared" barrier built on the property line.

Metro is amenable to sharing costs for certain improvements that allow for clarity in responsibilities and adequate ongoing maintenance from adjacent property owners without entering Metro's property. Metro Real Estate should be contacted with case-specific questions and will need to approve shared barrier design, shared financing, and construction.



Double barrier conditions allow trash accumulation and create maintenance challenges for Metro and adjacent property owners.



Metro prefers a single barrier condition along its ROW property line.

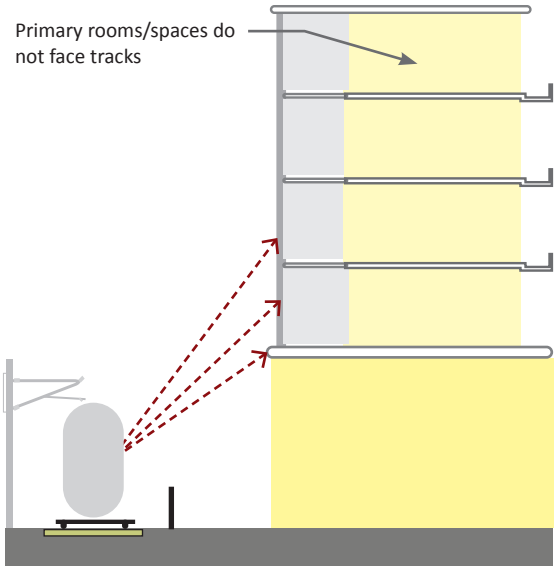
1.7 Project Orientation & Noise Mitigation

Metro may operate in and out of revenue service 24 hours per day, every day of the year, which can create noise and vibration (i.e. horns, power washing). Transit service and maintenance schedules cannot be altered to avoid noise for adjacent developments. However, noise and vibration impacts can be reduced through building design and orientation.

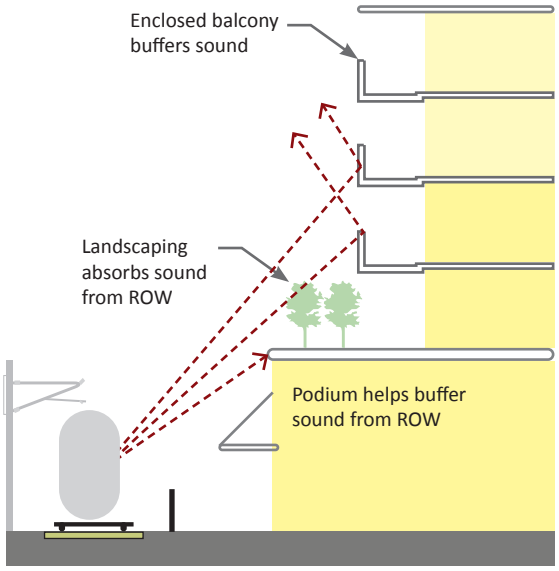
RECOMMENDATION: Use building orientation, programming, and design techniques to reduce noise and vibration for buildings along Metro ROW:

- Locate secondary or "back of house" rooms (e.g. bathrooms, stairways, laundry rooms) along ROW, rather than primary living spaces that are noise sensitive (e.g. bedrooms and family rooms).
- Use upper level setbacks and locate living spaces away from ROW.
- Enclose balconies.
- Install double-pane windows.
- Include language disclosing potential for noise, vibration, and other impacts due to transit proximity in terms and conditions for building lease or sale agreements to protect building owners/sellers from tenant/buyer complaints.

Developers are responsible for any noise mitigation required, which may include engineering designs for mitigation recommended by Metro or otherwise required by local municipalities. A recorded Noise Easement Deed in favor of Metro may be required for projects within 100 feet of Metro ROW to ensure notification to tenants and owners of any proximity issues.



Building orientation can be designed to face away from tracks, reducing the noise and vibration impacts.



Strategic placement of podiums and upper-level setbacks on developments near Metro ROW can reduce noise and vibration impacts.

1.8 At-Grade Rail Crossings

New development is likely to increase pedestrian activity at rail crossings. Safety enhancements may be needed to upgrade existing rail crossings to better protect pedestrians.

RECOMMENDATION: Coordinate with Metro, the California Public Utilities Commission (CPUC), and any other transit operators using the crossing (e.g. Metrolink) to determine if safety enhancements are needed for nearby rail crossings.

While Metro owns and operates the rail ROW, the CPUC regulates all rail crossings. Contact the CPUC early in the design process to determine if they will require any upgrades to existing rail crossings. The CPUC may request to review development plans and hold a site visit to understand future pedestrian activity. Metro's Corporate Safety Department can support the developer in coordination with the CPUC.

Gates and pedestrian arms are common types of safety elements for pedestrians at rail crossings.

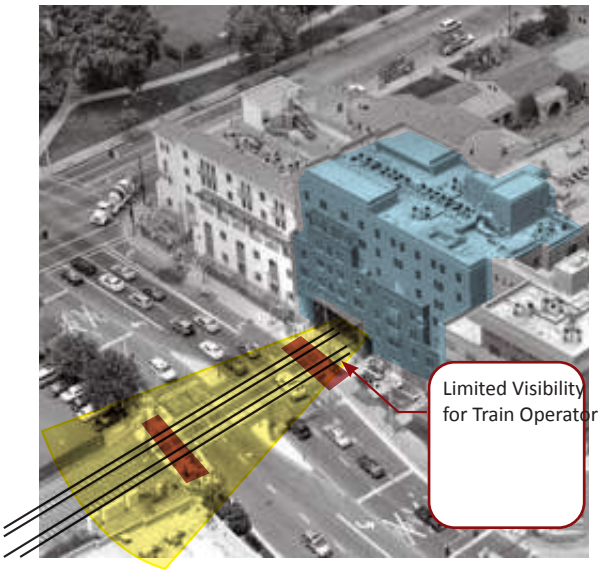
Safety elements of a gate and pedestrian arms have been constructed at the Monrovia Station.

1.9 Sight-Lines at Crossings

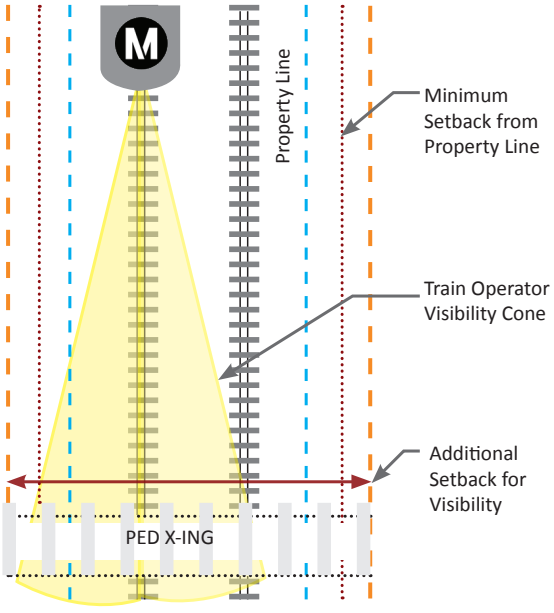
Developments adjacent to Metro ROW can present visual barriers to transit operators approaching vehicular and pedestrian crossings. Buildings and structures in close proximity to transit corridors can reduce sight-lines and create blind corners where operators cannot see pedestrians. This requires operations to reduce train speeds, which decreases efficiency of transit service.

RECOMMENDATION: Design buildings to maximize transit service sight-lines at crossings, leaving a clear cone of visibility to oncoming vehicles and pedestrians.

Metro Rail Operations will review, provide guidance, and determine the extent of operator visibility for safe operations. If the building envelope overlaps with the visibility cone near pedestrian and vehicular crossings, a building setback may be necessary to ensure safe transit service. The cone of visibility at crossings and required setback will be determined based on vehicle approach speed.



Limited sight-lines for trains approaching street crossings create unsafe conditions.



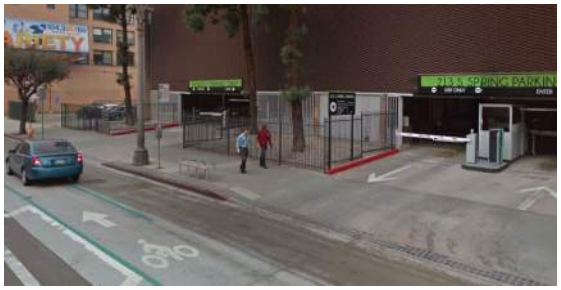
Visibility cones allow train operators to respond to safety hazards.

1.10 Driveway/Access Management

Driveways adjacent to on-street bus stops can create conflict for pedestrians walking to/from or waiting for transit. Additionally, driveways accessing parking lots and loading zones at project sites near Metro Rail and BRT crossings can create queuing issues along city streets and put vehicles in close proximity to fast moving trains and buses, which pose safety concerns.

RECOMMENDATION: Site driveways and other vehicular entrances to avoid conflicts with pedestrians, bicycles, and transit vehicles by:

- Placing driveways along side streets and alleys, away from on-street bus stops and transit crossings to minimize safety conflicts between active ROW, transit vehicles, and people, as well as queuing on streets.
- Locating vehicular driveways away from transit crossings or areas that are likely to be used as waiting areas for transit services.
- Placing loading docks away from sidewalks where transit bus stop activity is/will be present.
- Consolidating vehicular entrances and reduce width of driveways.
- Using speed tables to slow entering/exiting automobiles near pedestrians.
- Separating pedestrian walkways to minimize conflict with vehicles.
- Encouraging safe non-motorized travel.



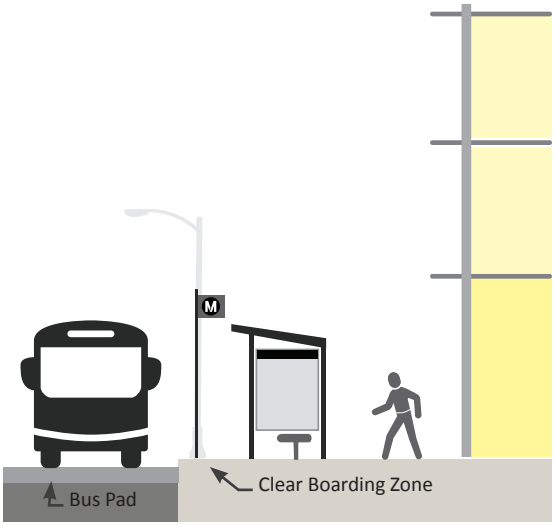
Driveways in close proximity to each other compromise safety for those walking to/from transit and increase the potential for vehicle-pedestrian conflicts.

1.11 Bus Stop & Zones Design

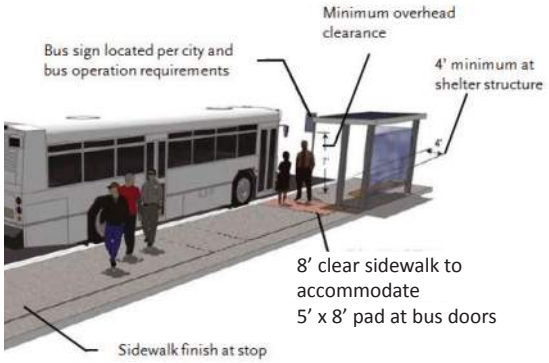
Metro Bus serves over 15,000 bus stops throughout the diverse landscape that is LA County. Typically located on sidewalks within public right-of-way owned and maintained by local jurisdictions, existing bus stop conditions vary from well-lit and sheltered spaces to uncomfortable and unwelcoming zones. Metro is interested in working with developers and local jurisdictions to create a vibrant public realm around new developments by strengthening multi-modal access to/ from Metro transit stops and enhancing the pedestrian experience.

RECOMMENDATION: When designing around existing or proposed bus stops:

- Review Metro's Transit Service Policy, which provides standards for design and operation of bus stops and zones for near-side, far-side, and mid-block stops.
- Review Metro's Transfers Design Guide for more information at https://www.metro.net/projects/station-design-projects/
- Accommodate 5' x 8' landing pads at bus doors (front and back door, which are typically 23 to 25 feet apart).
- Locate streetscape elements (e.g. tree planters, street lamps, benches, shelters, trash receptacles and newspaper stands) outside of bus door zones to protect transit access and ensure a clear path of travel.
- Install a concrete bus pad within each bus stop zone to avoid street asphalt damage.
- Replace stand-alone bus stop signs with bus shelters that include benches and adequate lighting.
- Design wide sidewalks (15' preferred) that accommodate bus landing pads as well as street furniture, landscape, and user travel space.
- Consider tree species, height, and canopy shape (higher than 14' preferred) to avoid vehicle conflicts at bus stops. Trees should be set back from the curb and adequately maintained to prevent visual and physical impediments for buses when trees reach maturity. Avoid planting of trees that have an invasive and shallow root system.



A concrete bus pad should be located at bus stops and bus shelters should be located along sidewalks to ensure an accessible path of travel to a clear boarding area.



Well-designed and accessible bus stops are beneficial amenities for both transit riders and users of adjacent developments.

Engineering & Technical Review

Engineering & Technical Review

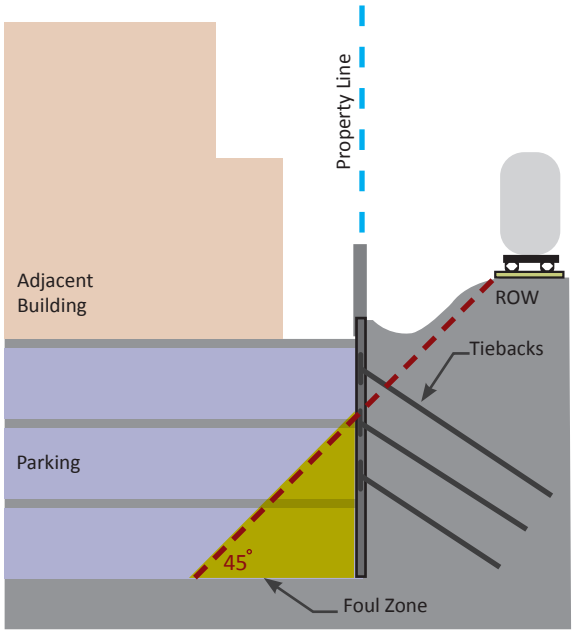
2.1 Excavation Support System Design

Excavation near Metro ROW has the potential to disturb adjoining soils and jeopardize support of existing Metro infrastructure. Any excavation which occurs within the geotechnical foul zone relative to Metro infrastructure is subject to Metro review and approval and meet Cal/OSHA requirements. This foul zone or geotechnical zone of influence shall be defined as the area below a track-way as measured from a 45-degree angle from the edge of the rail track ballast. Construction within this vulnerable area poses a potential risk to Metro service and requires additional Metro Engineering review.

RECOMMENDATION: Coordinate with Metro Engineering staff for review and approval of the excavation support system drawings and calculations prior to the start of excavation or construction. Tiebacks encroaching into Metro ROW may require a tieback easement or license, at Metro's discretion.

Any excavation/shoring within Metrolink operated and maintained ROW will require compliance with SCRRA Engineering standards and guidelines.

See page 7 for a sample section showing Metro adjacent conditions.



An underground structure located within the ROW foul zone would require additional review by Metro.

2.2 Proximity to Tunnels & Underground Infrastructure

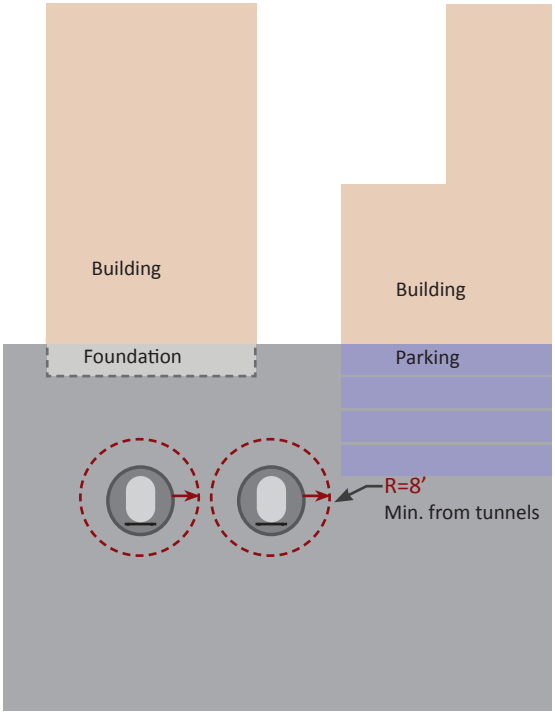
Construction adjacent to, over, or below underground Metro facilities (tunnels, stations and appendages) is of great concern and should be coordinated closely with Metro Engineering.

RECOMMENDATION: Coordinate with Metro early in the design process when proposing to build near underground Metro infrastructure. Metro typically seeks to maintain a minimum eight (8) foot clearance from existing Metro facilities to new construction (shoring or tiebacks). It will be incumbent upon the developer to demonstrate, to Metro's satisfaction, that both the temporary support of construction and the permanent works do not adversely affect the structural integrity, safety, or continued efficient operation of Metro facilities.

Dependent on the nature of the adjacent construction, Metro will need to review the geotechnical report, structural foundation plans, sections, shoring plan sections and calculations.

Metro may require monitoring where such work will either increase or decrease the existing overburden (i.e. weight) to which the tunnels or facilities are subjected. When required, the monitoring will serve as an early indication of excessive structural strain or movement. See Section 3.4, Excavation Drilling/Monitoring for additional information regarding monitoring requirements.

See page 7 for a sample section showing Metro adjacent conditions.

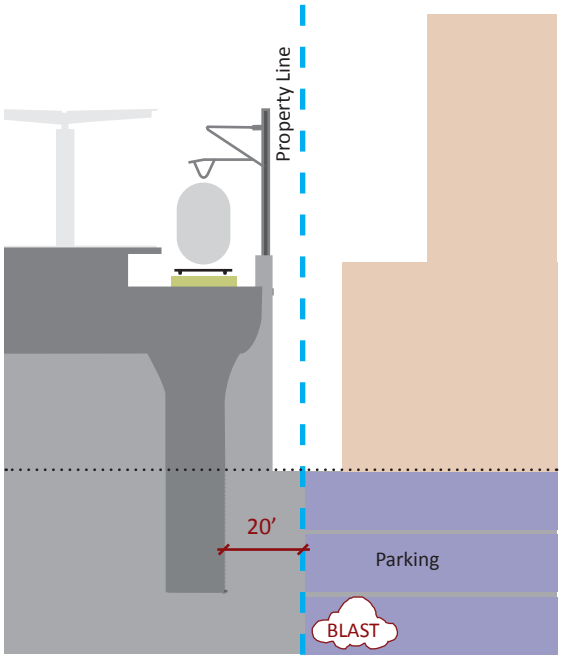


Adjacent project structures in close proximity to underground Metro infrastructure will require additional review by Metro.

2.3 Protection from Explosion/Blast

Metro is obligated to ensure the safety of public transit infrastructure from potential explosive sources which could originate from adjacent underground structures or from at-grade locations, situated below elevated guideways or near stations. Blast protection setbacks or mitigation may be required for large projects constructed near critical Metro facilities.

RECOMMENDATION: Avoid locating underground parking or basement structures within twenty (20) feet from an existing Metro tunnel or facility (exterior face of wall to exterior face of wall). Adjacent developments within this 20-foot envelope may be required to submit a Threat Assessment and Blast/Explosion Study for Metro review and approval.



An underground structure proposed within twenty (20) feet of a Metro structure may require a Threat Assessment and Blast/Explosion Study.

Construction Safety & Management

Construction Safety & Management

3.1 Pre-Construction Coordination

Metro is concerned with impacts to service requiring rail single line tracking, line closures, speed restrictions, and bus bridging occurring as a result of adjacent project construction. Projects that will require work over, under, adjacent, or on Metro property or ROW and include operation of machinery, scaffolding, or any other potentially hazardous work are subject to evaluation in preparation for and during construction to maintain safe transit operations and passenger well-being.

RECOMMENDATION: Following an initial screening of the project, Metro may determine that additional on-site coordination may be necessary. Dependent on the nature of the adjacent construction, developers may be requested to perform the following as determined on a case-by-case basis:

- Submit a construction work plan and related project drawings and specifications for Metro review.
- Submit a contingency plan, show proof of insurance coverage, and issue current certificates.
- Provide documentation of contractor qualifications.
- Complete pre-construction surveys, perform baseline readings, and install movement instrumentation.
- Complete readiness review and perform practice run of transit service shutdown per contingency plan.
- Designate a ROW observer or other safety personnel and an inspector from the project's construction team.
- Establish a coordination process for access and work in or adjacent to ROW for the duration of construction.

Project teams will be responsible for the costs of adverse impacts to Metro transit operations caused by work on adjacent developments, including remedial work to repair damage to Metro property, facilities, or systems. Additionally, a Construction Monitoring fee may be assessed based on an estimate of required level of effort provided by Metro.

All projects adjacent to Metrolink infrastructure will require compliance with SCRRA Engineering Standards and Guidelines.

Metro may need to monitor development construction near Metro facilities.

3.2 Track Access and Safety

Permission from Metro is required to enter Metro property for rail construction and maintenance along, above, or under Metro ROW as these activities can interfere with Metro utilities and service and pose a safety hazard to construction teams and transit riders. Track access is solely at Metro's discretion and is discouraged to prevent electrocution and collisions with construction workers or machines.

RECOMMENDATION: Obtain and/or complete the following to work in or adjacent to Metro Rail ROW:

1. **Construction Work Plan:** Dependent on the nature of adjacent construction, Metro may request a construction work plan, which describes means and methods and other construction plan details, to ensure the safety of transit operators and riders.

2. **Safety Training:** All members of the project construction team will be required to attend Metro Rail Safety Training before commencing work activity. Training provides resources and procedures when working near active rail ROW.

3. **Right of Entry Permit/Temporary Construction Easement:** All access to and activity on Metro property, including easements necessary for construction of adjacent projects, must be approved through a Right-of-Entry Permit and/or a Temporary Construction Easement obtained from Metro Real Estate and may require a fee.

4. **Track Allocation:** All work on Metro Rail ROW must receive prior approval from Metro Rail Operations Control. Track Allocation identifies, reserves, and requests changes to normal operations for a specific track section, line, station, location, or piece of equipment to allow for safe use by a non-Metro entity. If adjacent construction is planned in close proximity to active ROW, flaggers must be used to ensure safety of construction workers and transit riders.

Trained flaggers ensure the safe crossing of pedestrians and workers of an adjacent development.

3.3 Construction Hours

Building near active Metro ROW poses safety concerns and may require limiting hours of construction which impact Metro ROW to night or off-peak hours so as not to interfere with Metro revenue service. To maintain public safety and access for Metro riders, construction should be planned, scheduled, and carried out in a way to avoid impacts to Metro service and maintenance.

RECOMMENDATION: In addition to receiving necessary construction approvals from the local jurisdiction, all construction work on or in close proximity to Metro ROW must be scheduled through the Track Allocation Process, detailed in Section 3.2.

Metro prefers that adjacent construction with potential to impact normal, continuous Metro operations take place during non-revenue hours (approximately 1am-4am) or during non-peak hours to minimize impacts to service. The developer may be responsible for additional operating costs resulting from disruption to normal Metro service.

Construction during approved hours ensures the steady progress of adjacent development construction and minimizes impacts to Metro's transit service.

3.4 Excavation/Drilling Monitoring

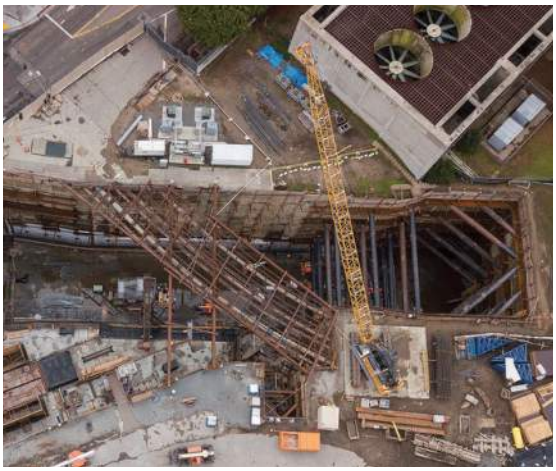
Excavation is among the most hazardous construction activities and can pose threats to the structural integrity of Metro's transit infrastructure.

RECOMMENDATION: Coordinate with Metro Engineering to review and approve excavation and shoring plans during design and development, and well in advance of construction (see Sections 2.1 and 2.2).

Geotechnical instrumentation and monitoring will be required for all excavations occurring within Metro's geotechnical zone of influence, where there is potential for adversely affecting the safe and efficient operation of transit vehicles. Monitoring of Metro facilities due to adjacent construction may include the following as determined on a case-by-case basis:

- Pre- and post-construction condition surveys
- Extensometers
- Inclinometers
- Settlement reference points
- Tilt-meters
- Groundwater observation wells
- Movement arrays
- Vibration monitoring

Excavation and shoring plans must be reviewed by Metro to ensure structural compatibility with Metro infrastructure and safety during adjacent development construction.



A soldier pile wall used for Regional Connector station at 2nd/Hope.

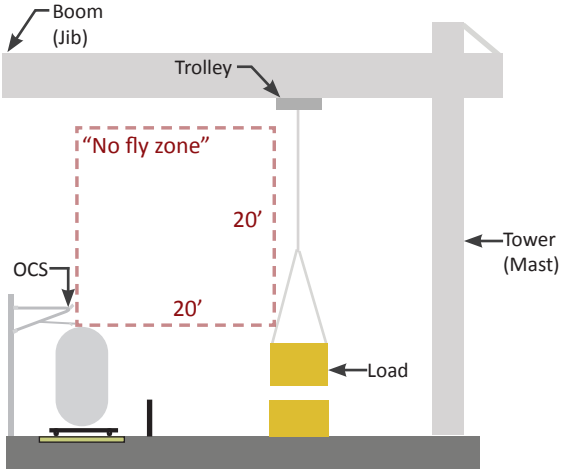
3.5 Crane Operations

Construction activities adjacent to Metro ROW may require moving large, heavy loads of building materials and machinery using cranes. Cranes referenced here include all power-operated equipment that can hoist, lower, and horizontally move a suspended load. To ensure safety for Metro riders, operators, and transit facilities, crane operations adjacent to Metro ROW must follow the safety regulations and precautions below and are subject to California Occupational Safety and Health Administration (Cal/OSHA) standards.

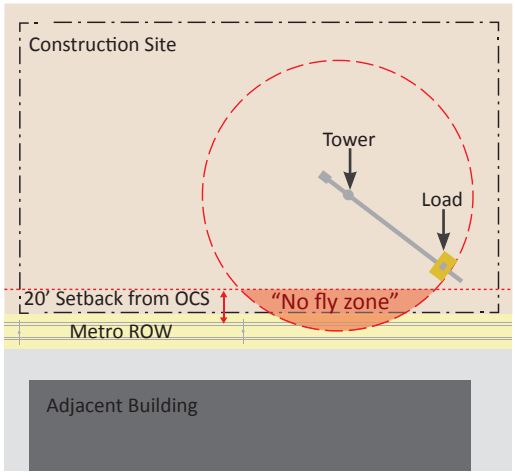
RECOMMENDATION:
Coordinate with Metro to discuss construction methods and confirm if a crane work plan is required. Generally, crane safety near Metro's ROW and facilities largely depends on the following factors: 1) Metro's operational hours and 2) swinging a load over or near Metro power lines and facilities. Note:

1. Clearance: A crane boom may travel over energized Metro OCS only if it maintains a vertical 20-foot clearance and the load maintain a horizontal 20-foot clearance.
2. Power: Swinging a crane boom with a load over Metro facilities or passenger areas is strictly prohibited during revenue hours. To swing a load in the "no fly zone" (see diagrams to right), the construction team must coordinate with Metro to de-energize the OCS.
3. Weathervaning: When not in use, the crane boom may swing 360 degrees with the movement of the wind, including over energized Metro OCS, only if the trolley is fully retracted towards the crane tower and not carrying any loads.
4. Process: Developers and contractors must attend Metro Track Allocation (detailed in Section 3.2) to determine if Metro staff support is necessary during crane erection and load movement.
5. Permit: Developers must apply for a Metro Right-of-Entry permit to swing over Metro facilities.

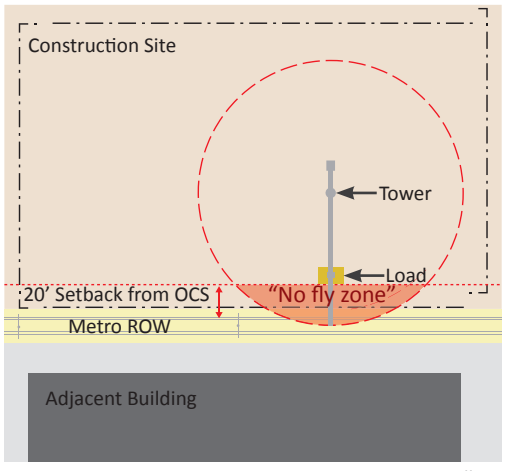
Project teams will bear all costs associated with impacts to Metro Rail operations and maintenance.



Cranes and construction equipment should be staged to avoid conflicts with the rail OCS.



Plan View: Crane swing and load are restricted near Metro ROW.



Plan View: While crane boom swings over "no fly zone," the trolley and load are retracted to maintain clearance from OCS.

3.6 Construction Barriers & Overhead Protection

During construction, falling objects can damage Metro facilities and pose a safety concern to the riders accessing them.

RECOMMENDATION: Erect vertical construction barriers and overhead protection compliant with Metro and Cal/OSHA requirements to prevent objects from falling into Metro ROW or areas designed for public access to Metro facilities. A protection barrier shall be constructed to cover the full height of an adjacent project and overhead protection from falling objects shall be provided over Metro ROW as necessary. Erection of the construction barriers and overhead protection for these areas shall be done during Metro non-revenue hours.

Overhead protection is required when moving heavy objects over Metro ROW or in areas designated for public use.

Constructed above is a wooden box over the entrance portal for overhead protection at the 4th/Hill Station.

3.7 Pedestrian & Emergency Access

Metro's riders rely on the consistency and reliability of access and wayfinding to and from stations, stops, and facilities. Construction on adjacent property must not obstruct pedestrian access, fire department access, emergency egress, or otherwise present a safety hazard to Metro operations, its employees, riders, and the general public. Fire access and safe escape routes within all Metro stations, stops, and facilities must be maintained at all times.

Sidewalk access is blocked for a construction project, forcing pedestrians into the street or to use less direct paths to the Metro facility.

RECOMMENDATION: Ensure pedestrian and emergency access from Metro stations, stops, and transit facilities is compliant with the Americans with Disabilities Act (ADA) and maintained during construction:

- Temporary fences, barricades, and lighting should be installed and watchmen provided for the protection of public travel, the construction site, adjacent public spaces, and existing Metro facilities.
- Temporary signage should be installed where necessary and in compliance with the latest California Manual on Uniform Traffic Control Devices (MUTCD) and in coordination with Metro Art and Design Standards.
- Emergency exits shall be provided and be clear of obstructions at all times.
- Access shall be maintained for utilities such as fire hydrants, stand pipes/connections, and fire alarm boxes as well as Metro-specific infrastructure such as fan and vent shafts.

3.8 Impacts to Bus Routes & Stops

During construction, bus stop zones and routes may need to be temporarily relocated. Metro needs to be informed of activities that require stop relocation or route adjustments in order to ensure uninterrupted service.

RECOMMENDATION: During construction, maintain or relocate existing bus stops consistent with the needs of Metro Bus Operations. Design of temporary and permanent bus stops and surrounding sidewalk areas must be compliant with the ADA and allow passengers with disabilities a clear path of travel to the transit service. Existing bus stops must be maintained as part of the final project. Metro Bus Operations Control Special Events Department and Metro Stops & Zones Department should be contacted at least 30 days before initiating construction activities.

Temporary and permanent relocation of bus stops and layover zones will require coordination between developers, Metro, and other municipal bus operators and local jurisdictions.

3.9 Utility Coordination

Construction has the potential to interrupt utilities that Metro relies on for safe operations and maintenance. Utilities of concern to Metro include, but are not limited to, condenser water piping, potable/fire water, storm and sanitary sewer lines, and electrical/ telecommunication services.

RECOMMENDATION: Coordinate with Metro Real Estate during project design to gauge temporary and permanent utility impacts and avoid conflicts during construction.

The contractor shall protect existing above-ground and underground Metro utilities during construction and coordinate with Metro to receive written approval for any utilities pertinent to Metro facilities that may be used, interrupted, or disturbed.

When electrical power outages or support functions are required, approval must be obtained through Metro Track Allocation in coordination with Metro Real Estate for a Right of Entry Permit.

To begin coordination with Metro Real Estate, visit www.metro.net/devreview and select the drop-down "Utility Project Coordination."

Coordination of underground utilities is critical to safely and efficiently operate Metro service.

3.10 Air Quality & Ventilation Protection

Hot or foul air, fumes, smoke, steam, and dust from adjacent construction activities can negatively impact Metro facilities, service, and users.

RECOMMENDATION: Ensure that hot or foul air, fumes, smoke, and steam from adjacent facilities are discharged beyond 40 feet from existing Metro facilities, including but not limited to ventilation system intake shafts and station entrances. Should fumes be discharged within 40 feet of Metro intake shafts, a protection panel around each shaft shall be required.

A worker breaks up concrete creating a cloud of silica dust.

Glossary

Cone of Visibility
A conical space at the front of moving transit vehicles allowing for clear visibility of travel way and/or conflicts.

Construction Work Plan (CWP)
Project management document outlining the definition of work tasks, choice of technology, estimation of required resources and duration of individual tasks, and identification of interactions among the different work tasks.

Flagger/Flagman
Person who controls traffic on and through a construction project. Flaggers must be trained and certified by Metro Rail Operations prior to any work commencing in or adjacent to Metro ROW.

Geotechnical Foul Zone
Area below a track-way as measured from a 45-degree angle from the edge of the rail track ballast.

Guideway
A channel, track, or structure along which a transit vehicle moves.

Heavy Rail Transit (HRT)
Metro HRT systems include exclusive ROW (mostly subway) trains up to six (6) cars long (450') and utilize a contact rail for traction power distribution (e.g. Metro Red Line).

Joint Development (JD)
JD is the asset management and real estate development program through which Metro collaborates with developers to build housing, retail, and other amenities on Metro properties near transit, typically through ground lease. JD projects directly link transit riders with destinations and services throughout LA County.

Light Rail Transit (LRT)
Metro LRT systems include exclusive, semi-exclusive, or street ROW trains up to three (3) cars long (270') and utilize OCS for traction power distribution (e.g. Metro Blue Line).

Measure R
Half-cent sales tax for LA County approved in November 2008 to finance new transportation projects and programs. The tax expires in 2039.

Measure M
Half-cent sales tax for LA County approved in November 2016 to fund transportation improvements, operations and programs, and accelerate projects already in the pipeline. The tax will increase to one percent in 2039 when Measure R expires.

Metrolink
A commuter rail system with seven lines throughout Los Angeles, Orange, Riverside, San Bernardino, Ventura, and North San Diego counties governed by the Southern California Regional Rail Authority (SCRRA).

Metro Adjacent Construction Design Manual
Volume III of the Metro Design Criteria & Standards, which outlines the Metro adjacent review procedure as well as operational requirements when constructing over, under, or adjacent to Metro facilities, structures, and property.

Metro Bus
Metro "Local" and "Rapid" bus service runs within the street, typically alongside vehicular traffic, though occasionally in "bus-only" lanes.

Metro Bus Rapid Transit (BRT)
High quality bus service that provides faster and convenient service through the use of dedicated ROW, branded vehicles and stations, high frequency and intelligent transportation systems, all-door boarding, and intersection crossing priority. Metro BRT may run within dedicated ROW or in mixed flow traffic on streets.

Metro Design Criteria and Standards
A compilation of documents that govern how Metro transit service and facilities are designed, constructed, operated, and maintained.

Metro Rail
Urban rail system serving LA County consisting of six lines, including two subway lines and four light rail lines.

Metro Rail Design Criteria (MRDC)
Volume IV of the Metro Design Criteria & Standards which establishes design criteria for preliminary engineering and final design of a Metro Rail Project.

Metro Transit Oriented Communities
Land use planning and community development program that seeks to maximize access to transportation as a key organizing principle and promote equity and sustainable living by offering a mix of uses close to transit to support households at all income levels, as well as building densities, parking policies, urban design elements, and first/last mile facilities that support ridership and reduce auto dependency.

Noise Easement Deed
Easement granted by property owners abutting Metro ROW acknowledging noise due to transit operations and maintenance.

Overhead Catenary System (OCS)
One or more electrified wires situated over a transit ROW that transmit power to light rail trains via pantograph, a current collector mounted on the roof of an electric vehicle. Metro OCS is supported by hollow poles placed between tracks or on the outer edge of parallel tracks.

Right of Entry Permit
Written approval granted by Metro Real Estate to enter Metro ROW and property.

Right of Way (ROW)
Legal right over property reserved for transportation purposes to construct, protect, maintain and operate transit services.

Southern California Regional Rail Authority (SCRRA)
A joint powers authority made up of an 11-member board representing the transportation commissions of Los Angeles, Orange, Riverside, San Bernardino and Ventura counties. SCRRA governs and operates Metrolink service.

Threat Assessment and Blast/Explosion Study
Analysis performed when adjacent developments are proposed within twenty (20) feet from an existing Metro tunnel or facility.

Track Allocation/Work Permit
Permit granted by Metro Rail Operations Control to allocate a section of track and perform work on or adjacent to Metro Rail ROW. This permit should be submitted for any work that could potentially foul the envelope of a train.

Wayfinding
Signs, maps, and other graphic or audible methods used to convey location and directions to travelers.

metro.net/projects/devreview/

Metro

Letter No. A7

Shine Ling, AICP, Senior Manager
Development Review Team
Transit Oriented Communities
Metro Development Review
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza, MS 99-22-1
Los Angeles, CA 90012

Response to Comment No. A7-1

The comment briefly summarizes the Los Angeles County Metropolitan Transportation Authority's (Metro) commitment to working with local municipalities, developers, and stakeholders on transit-supportive developments to grow ridership, reduce driving, and promote walkable neighborhoods. The comment also describes Metro's statutory responsibly related to Metro-owned right-of-way (ROW). Metro also attaches the Metro Adjacent Development Handbook, which provides an overview of common concerns for development adjacent to Metro-owned ROW and transit facilities.

The comment also briefly summarizes the Project description. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A7-2

The comment identifies the statutory responsibilities of Metro as a Responsible Agency under CEQA, particularly as related to the approval of a license agreement for the proposed Class I multi-purpose path along Railroad Avenue and the 13th Street crossing improvements. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A7-3

This comment advises the Project Applicant regarding rail operations in the railroad ROW. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. A7-4

The Draft EIR analyzed all environmental impacts pursuant to CEQA and incorporated all feasible mitigation measures. The Draft EIR addressed traffic in Section 4.14, Transportation, of the Draft EIR, with supporting data provided in Appendix L of the Draft EIR. The Applicant will comply with all applicable requirements for construction and operation adjacent to the Southern California Regional Rail Authority (SCRRA) Metrolink ROW. Through the building permit process, the Project will continue consultation with Metro prior to construction within 100 feet of Metro-owned ROW, including the Class I multi-purpose path along the north side of 13th Street. Through consultation, the Project will demonstrate consistency with Metro's Adjacent Development Handbook and Metro's Adjacent Construction Design Manual.

Response to Comment No. A7-5

As discussed in Response to Comment No. A7-4 above, the Applicant will comply with all applicable requirements for construction and operation adjacent to the SCRRA Metrolink ROW. Through the building permit process, the Project will continue consultation with Metro prior to construction within 100 feet of Metro-owned ROW, including the Project perimeter wall, landscape, Class I multi-purpose trail along the north side of 13th Street, and underground storm drains and utilities.

Response to Comment No. A7-6

As discussed in Response to Comment No. A7-4 above, the Applicant will comply with all applicable requirements for construction and operation adjacent to the SCRRA Metrolink ROW. Through the building permit process, the Project will continue consultation with Metro prior to construction within 100 feet of Metro-owned ROW, including the Class I multi-purpose path along the north side of 13th Street.

Response to Comment No. A7-7

As discussed in Response to Comment No. A7-4 above, the Applicant will comply with all applicable requirements for construction and operation adjacent to the SCRRA Metrolink ROW, including construction equipment placement, setbacks, access, and construction monitoring. Through the building permit process and on-going consultation with Metro, the Project will demonstrate consistency with Metro's Adjacent Development Handbook and Metro's Adjacent Construction Design Manual.

Response to Comment No. A7-8

The 13th Street crossing configuration has had several diagnostic meetings with the CPUC, roadway authority, Metro, and associated railroads in 2019 and 2022, and the projected future volumes have been shared with the roadway authority, associated railroads, and CPUC. The design introduced queuing prevention measures, including a pre-signal for westbound 13th Street, interconnection with the railroad, and queue loops for eastbound 13th Street. Comments from the CPUC and diagnostic team have been included and addressed in the design accordingly.

Response to Comment No. A7-9

As discussed in Response to Comment No. A7-4 above, the Applicant will comply with all applicable requirements for construction and operation adjacent to the SCRRA Metrolink ROW, including Occupational Safety and Health Administration (OSHA) requirements, during construction and/or excavation activities in proximity to Metro-owned ROW. The commenter's advisories regarding technical review and costs of impacts are noted. However, the Project would not require noise mitigation, and, as such, there would be no cost related to such mitigation.

Response to Comment No. A7-10

The comment recommends that the Applicant review the Transit Supportive Planning Toolkit to reduce vehicle miles traveled (VMT). The Project includes features that support transit and reduce VMT, such as its location near public transit, diverse mix of land uses (including Old Town Newhall), provision of new sidewalks along the Project frontage, provision of bicycle amenities (e.g. long- and short-term parking), and provision of a Class I multi-purpose path. In addition,

Project Design Feature PDF-TA-1, which is described on page 4.14-12 in the Draft EIR, would further reduce the Project's VMT and encourage transit use by incorporating several Transportation Demand Measures (TDM) into the Project, including the features that have been identified above, as well as flexible work schedules and telecommuting programs, carpool programs, flex car support, and preferential parking locations for high-occupancy vehicles. The Applicant will review and take into consideration recommendations of the toolkit prior to final building design.

Response to Comment No. A7-11

The comment recommends that the Applicant implement a range of specific features related to transit connections and access, walkability, bicycle use and micro-mobility devices, and first/last mile access. The Project would be developed approximately 2,500 feet north of the Jan Heidt Newhall Metrolink Station, which is an intermodal hub that, in addition to providing access to the Metrolink passenger rail system, is served by (1) Santa Clarita Transit (SCT) local lines, which connect the Newhall community to other parts of the City, including Bouquet Canyon, Plum Canyon, and Canyon Country, as well as to the McBean Regional Transit Center and the Santa Clarita (Soledad) Metrolink Station; (2) SCT commuter express lines, which connect Santa Clarita to North Hollywood and the Metro B and G Lines; Woodland Hills, Canoga Park, and Chatsworth; UCLA, Westwood, and Century City; and Union Station and Downtown Los Angeles; (3) Amtrak Thruway buses, which offer a connection between the Jan Heidt Newhall Metrolink Station and the Amtrak Bakersfield Station, a transfer point to and from the San Joaquins trains to Oakland and Sacramento; and (4) the Antelope Valley Transit Authority (AVTA) North County TRANSporter, which travels between the Palmdale Transportation Center and the Jan Heidt Newhall Metrolink Station, connecting Antelope Valley residents to the Santa Clarita Valley. Accordingly, the Project's location near multiple public transit options would improve mobility, accessibility, reliability, and travel safety for Project employees. In addition, the Project would provide dedicated pedestrian access to the Project Site via new sidewalks along the Project frontage and internal to the Project Site. Pedestrian access would be provided at all three driveways and would be concentrated at the signalized intersection. Pedestrian paths of travel would be routed away from vehicle traffic to the extent possible. Most pedestrian trips would either be internal trips within the Project Site or trips between Project uses and the Jan Heidt Newhall Metrolink Station or nearby commercial businesses. The vast majority of pedestrians traveling to or from the Project Site are not expected to walk across uncontrolled Project vehicular access points. Instead, pedestrian trips are concentrated at new signalized intersection and crosswalks and internal sidewalks.

The Project would also promote the use of bicycles by constructing a Class I multi-purpose path along the Project frontage at 12th Street, Arch Street, and 13th Street. In addition, the Project would be conditioned to either (1) pay an in-lieu fee to contribute toward improvements or (2) construct a connection to provide a link for pedestrians and bicyclists between the Project Site and the Jan Heidt Newhall Metrolink Station and the Old Town Newhall dining and entertainment district. The Project would also provide 170 bicycle parking spaces (145 long-term spaces and 25 short-term spaces).

These Project features provide first/last mile connections inclusive of all modes of transportation.

Response to Comment No. A7-12

In conformance with the City's Uniform Development Code, the Project would be required to provide 2,969 parking spaces. However, the Project would provide a reduced number of 2,684 parking spaces as allowed under the Jobs Creation Overlay Zone that would be extended to the Project Site as part of the Project's entitlements.

RE: Response to Notice of Availability of a Draft Environmental Impact Report for the proposed Shadowbox Studios Project, (Master Case 21-109)

Dear Ms. Iverson:

Thank you for the opportunity to comment on the Notice of Availability (NOA) for the Draft Environmental Impact Report (DEIR) for the proposed Shadowbox Studios Project (Project). The Santa Clarita Valley Water Agency (SCV Water) submits the following comments for consideration.

In Section 4.9 of the DEIR the developer states that the potential for significant impacts in the depletion of groundwater supplies or interference with groundwater recharge are less than significant and that no mitigation measures are required.

As the Project would significantly increase the amount of impervious surface area over a known groundwater recharge area, SCV Water believes that the reduction of percolated rainwater could reduce the amount of water reaching the groundwater basin. A8-1

SCV Water recommends that to the extent possible, impervious surfaces throughout the Project be made permeable through the use of alternate methods of paving as to not reduce the volume of water reaching the groundwater basin. The percolation of water into the local groundwater basins provides a vital water resource to the Santa Clarita Valley.

SCV Water requests the City have the developer explore additional solutions that increase the permeability of the Projects paved surfaces.

SCV Water appreciates your consideration of these comments.

Very truly yours,

Rick Vasilopulos
Santa Clarita Valley Water Agency

Cc: Stephen L. Cole – Assistant General Manager

Letter No. A8

Response to Comment No. A8-1

As described on page 4.9-16 in Section 4.9, Hydrology and Water Quality, of the Draft EIR, the Project would incorporate an infiltration and drainage basin, multiple catch basins, and landscape designed to minimize or eliminate runoff. On-site runoff from the Project Site would be captured in a closed pipe system and conveyed to Placerita Creek, a soft-bottom drainage channel that allows for percolation of surface water. Moreover, prior to discharging into Placerita Creek, the first-flush runoff would be routed through the underground infiltration chambers or infiltration/drainage basin proposed for the Project. Additionally, a portion of the off-site stormwater, during peak storm events, would be routed to the infiltration/drainage basin. The Project's proposed drainage/infiltration system would capture the first ¾ inch of rainfall from each storm event and use infiltration chambers/basin to infiltrate this rainfall back into the earth. Given this proposed system, the Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge. The Project would not impede sustainable groundwater management of the basin. Impacts in this regard are less than significant.

RE: City of Santa Clarita's Shadowbox Studios Project (Master Case 21-109) SCH# 2022030762

Dear Erika Iverson,

On behalf of the Southwest Mountain States Regional Council of Carpenters ("**Southwest Carpenters**" or "**SWMSRCC**"), my Office is submitting these comments for the City of Santa Clarita's ("**City**") April 18, 2023 Planning Commission Meeting for the Shadowbox Studios Project ("**Project**").

The Southwest Carpenters is a labor union representing over 63,000 union carpenters in 10 states, including California, and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects.

Individual members of the Southwest Carpenters live, work, and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

O1-1

The Southwest Carpenters expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. Gov. Code, § 65009, subd. (b); Pub. Res. Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

The Southwest Carpenters incorporates by reference all comments raising issues regarding the Environmental Impact Report (EIR) submitted prior to certification of

O1-2

the EIR for the Project. See *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal.App.4th 173, 191 (finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

O1-2 Continued

Moreover, the Southwest Carpenters requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (**CEQA**) (Pub. Res. Code, § 21000 *et seq.*), and the California Planning and Zoning Law ("**Planning and Zoning Law**") (Gov. Code, §§ 65000–65010). California Public Resources Code Sections 21092.2, and 21167(f) and California Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

O1-3

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY'S ECONOMIC DEVELOPMENT AND ENVIRONMENT

The City should require the Project to be built using a local workers who have graduated from a Joint Labor-Management Apprenticeship Program approved by the State of California, have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a state-approved apprenticeship training program, or who are registered apprentices in a state-approved apprenticeship training program.

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

O1-4

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

> [L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

Furthermore, workforce policies have significant environmental benefits given that they improve an area's jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas (GHG) emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District found that that the "[u]se of a local state-certified apprenticeship program" can result in air pollutant reductions.[2]

O1-4
Continued

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[3]

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled (VMT). As planning experts Robert Cervero and

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf.

[2] South Coast Air Quality Management District (May 7, 2021) Certify Final Environmental Assessment and Adopt Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305, Submit Rule 2305 for Inclusion Into the SIP, and Approve Supporting Budget Actions, *available at* http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-May7-027.pdf?sfvrsn=10.

[3] California Planning Roundtable (2008) Deconstructing Jobs-Housing Balance at p. 6, *available at* https://cproundtable.org/static/media/uploads/publications/cpr-jobs-housing.pdf

Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.[4] Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

O1-4
Continued

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 ("**AB2011**"). AB2011 amended the Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet affordability and labor requirements.

The City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

II. THE CITY SHOULD IMPOSE TRAINING REQUIREMENTS FOR THE PROJECT'S CONSTRUCTION ACTIVITIES TO PREVENT COMMUNITY SPREAD OF COVID-19 AND OTHER INFECTIOUS DISEASES

Construction work has been defined as a Lower to High-risk activity for COVID-19 spread by the Occupations Safety and Health Administration. Recently, several

[4] Cervero, Robert and Duncan, Michael (2006) Which Reduces Vehicle Travel More: Jobs-Housing Balance or Retail-Housing Mixing? Journal of the American Planning Association 72 (4), 475-490, 482, *available at* http://reconnectingamerica.org/assets/Uploads/UTCT-825.pdf.

construction sites have been identified as sources of community spread of COVID-19.[5]

Southwest Carpenters recommend that the Lead Agency adopt additional requirements to mitigate public health risks from the Project's construction activities. Southwest Carpenters requests that the Lead Agency require safe on-site construction work practices as well as training and certification for any construction workers on the Project Site.

In particular, based upon Southwest Carpenters' experience with safe construction site work practices, Southwest Carpenters recommends that the Lead Agency require that while construction activities are being conducted at the Project Site:

Construction Site Design:

- The Project Site will be limited to two controlled entry points.
- Entry points will have temperature screening technicians taking temperature readings when the entry point is open.
- The Temperature Screening Site Plan shows details regarding access to the Project Site and Project Site logistics for conducting temperature screening.
- A 48-hour advance notice will be provided to all trades prior to the first day of temperature screening.
- The perimeter fence directly adjacent to the entry points will be clearly marked indicating the appropriate 6-foot social distancing position for when you approach the screening area. Please reference the Apex temperature screening site map for additional details.
- There will be clear signage posted at the project site directing you through temperature screening.

O1-4
Continued

[5] Santa Clara County Public Health (June 12, 2020) COVID-19 CASES AT CONSTRUCTION SITES HIGHLIGHT NEED FOR CONTINUED VIGILANCE IN SECTORS THAT HAVE REOPENED, *available at* https://www.sccgov.org/sites/covid19/Pages/press-release-06-12-2020-cases-at-construction-sites.aspx.

- Provide hand washing stations throughout the construction site.

Testing Procedures:

- The temperature screening being used are non-contact devices.
- Temperature readings will not be recorded.
- Personnel will be screened upon entering the testing center and should only take 1-2 seconds per individual.
- Hard hats, head coverings, sweat, dirt, sunscreen or any other cosmetics must be removed on the forehead before temperature screening.
- Anyone who refuses to submit to a temperature screening or does not answer the health screening questions will be refused access to the Project Site.
- Screening will be performed at both entrances from 5:30 am to 7:30 am.; main gate [ZONE 1] and personnel gate [ZONE 2]
- After 7:30 am only the main gate entrance [ZONE 1] will continue to be used for temperature testing for anybody gaining entry to the project site such as returning personnel, deliveries, and visitors.
- If the digital thermometer displays a temperature reading above 100.0 degrees Fahrenheit, a second reading will be taken to verify an accurate reading.
- If the second reading confirms an elevated temperature, DHS will instruct the individual that he/she will not be allowed to enter the Project Site. DHS will also instruct the individual to promptly notify his/her supervisor and his/her human resources (HR) representative and provide them with a copy of Annex A.

Planning

O1-4
Continued

- Require the development of an Infectious Disease Preparedness and Response Plan that will include basic infection prevention measures (requiring the use of personal protection equipment), policies and procedures for prompt identification and isolation of sick individuals, social distancing (prohibiting gatherings of no more than 10 people including all-hands meetings and all-hands lunches) communication and training and workplace controls that meet standards that may be promulgated by the Center for Disease Control, Occupational Safety and Health Administration, Cal/OSHA, California Department of Public Health or applicable local public health agencies.[6]

O1-4
Continued

The United Brotherhood of Carpenters and Carpenters International Training Fund has developed COVID-19 Training and Certification to ensure that Carpenter union members and apprentices conduct safe work practices. The Agency should require that all construction workers undergo COVID-19 Training and Certification before being allowed to conduct construction activities at the Project Site.

Southwest Carpenters has also developed a rigorous Infection Control Risk Assessment ("**ICRA**") training program to ensure it delivers a workforce that understands how to identify and control infection risks by implementing protocols to protect themselves and all others during renovation and construction projects in healthcare environments.[7]

ICRA protocols are intended to contain pathogens, control airflow, and protect patients during the construction, maintenance and renovation of healthcare facilities. ICRA protocols prevent cross contamination, minimizing the risk of secondary infections in patients at hospital facilities.

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

O1-5

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

O1-5
Continued

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[4] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14-15.
[5] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.
[6] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added). [12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin

Air Basin	Rural (miles)	Urban (miles)
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8

[11] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.
[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

O1-5
Continued

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Presentations:

Rosenfeld, P.E., Sutherland, A; Hesse, R.; Zapata, A. (October 3-6, 2013). Air dispersion modeling of volatile organic emissions from multiple natural gas wells in Decatur, TX. *44th Western Regional Meeting, American Chemical Society.* Lecture conducted from Santa Clara, CA.

Sok, H.L.; Waller, C.C.; Feng, L.; Gonzalez, J.; Sutherland, A.J.; Wisdom-Stack, T.; Sahai, R.K.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Atrazine: A Persistent Pesticide in Urban Drinking Water. *Urban Environmental Pollution*. Lecture conducted from Boston, MA.

Feng, L.; Gonzalez, J.; Sok, H.L.; Sutherland, A.J.; Waller, C.C.; Wisdom-Stack, T.; Sahai, R.K.; La, M.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Bringing Environmental Justice to East St. Louis, Illinois. *Urban Environmental Pollution.* Lecture conducted from Boston, MA.

Rosenfeld, P.E. (April 19-23, 2009). Perfluoroctanoic Acid (PFOA) and Perfluoroactane Sulfonate (PFOS) Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*, Lecture conducted from Tuscon, AZ.

Rosenfeld, P.E. (April 19-23, 2009). Cost to Filter Atrazine Contamination from Drinking Water in the United States" Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*. Lecture conducted from Tuscon, AZ.

Wu, C., Tam, L., Clark, J., **Rosenfeld, P**. (20-22 July, 2009). Dioxin and furan blood lipid concentrations in populations living near four wood treatment facilities in the United States. Brebbia, C.A. and Popov, V., eds., *Air Pollution XVII: Proceedings of the Seventeenth International Conference on Modeling, Monitoring and Management of Air Pollution*. Lecture conducted from Tallinn, Estonia.

Rosenfeld, P. E. (October 15-18, 2007). Moss Point Community Exposure To Contaminants From A Releasing Facility. *The 23rd Annual International Conferences on Soils Sediment and Water.* Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). The Repeated Trespass of Tritium-Contaminated Water Into A Surrounding Community Form Repeated Waste Spills From A Nuclear Power Plant. *The 23rd Annual International Conferences on Soils Sediment and Water*. Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). Somerville Community Exposure To Contaminants From Wood Treatment Facility Emissions. The *23rd Annual International Conferences on Soils Sediment and Water*. Lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld P. E. (March 2007). Production, Chemical Properties, Toxicology, & Treatment Case Studies of 1,2,3-Trichloropropane (TCP). *The Association for Environmental Health and Sciences (AEHS) Annual Meeting*. Lecture conducted from San Diego, CA.

Rosenfeld P. E. (March 2007). Blood and Attic Sampling for Dioxin/Furan, PAH, and Metal Exposure in Florala, Alabama. *The AEHS Annual Meeting.* Lecture conducted from San Diego, CA.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (August 21 – 25, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *The 26th International Symposium on Halogenated Persistent Organic Pollutants – DIOXIN2006*. Lecture conducted from Radisson SAS Scandinavia Hotel in Oslo Norway.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (November 4-8, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *APHA 134 Annual Meeting & Exposition.* Lecture conducted from Boston Massachusetts.

Paul Rosenfeld Ph.D. (October 24-25, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. Mealey's C8/PFOA. *Science, Risk & Litigation Conference.* Lecture conducted from The Rittenhouse Hotel, Philadelphia, PA.

Paul Rosenfeld Ph.D. (September 19, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, *Toxicology and Remediation PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel, Irvine California.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference.* Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference.* Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus On Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water And Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference.* Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. and Rob Hesse R.G. (May 5-6, 2004). Tert-butyl Alcohol Liability and Toxicology, A National Problem and Unquantified Liability. *National Groundwater Association. Environmental Law Conference*. Lecture conducted from Congress Plaza Hotel, Chicago Illinois.

Paul Rosenfeld, Ph.D. (March 2004). Perchlorate Toxicology. *Meeting of the American Groundwater Trust*. Lecture conducted from Phoenix Arizona.

Hagemann, M.F., **Paul Rosenfeld, Ph.D.** and Rob Hesse (2004). Perchlorate Contamination of the Colorado River. *Meeting of tribal representatives*. Lecture conducted from Parker, AZ.

Paul Rosenfeld, Ph.D. (April 7, 2004). A National Damage Assessment Model For PCE and Dry Cleaners. *Drycleaner Symposium. California Ground Water Association*. Lecture conducted from Radison Hotel, Sacramento, California.

Rosenfeld, P. E., Grey, M., (June 2003) Two stage biofilter for biosolids composting odor control. *Seventh International In Situ And On Site Bioremediation Symposium Battelle Conference* Orlando, FL.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. (February 20-21, 2003) Understanding Historical Use, Chemical Properties, Toxicity and Regulatory Guidance of 1,4 Dioxane. *National Groundwater Association. Southwest Focus Conference. Water Supply and Emerging Contaminants*.. Lecture conducted from Hyatt Regency Phoenix Arizona.

Paul Rosenfeld, Ph.D. (February 6-7, 2003). Underground Storage Tank Litigation and Remediation. *California CUPA Forum*. Lecture conducted from Marriott Hotel, Anaheim California.

Paul Rosenfeld, Ph.D. (October 23, 2002) Underground Storage Tank Litigation and Remediation. *EPA Underground Storage Tank Roundtable*. Lecture conducted from Sacramento California.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Understanding Odor from Compost, *Wastewater and Industrial Processes. Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Using High Carbon Wood Ash to Control Compost Odor. *Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Grey, M. A. (September 22-24, 2002). Biocycle Composting For Coastal Sage Restoration. *Northwest Biosolids Management Association*. Lecture conducted from Vancouver Washington..

Rosenfeld, P.E. and Grey, M. A. (November 11-14, 2002). Using High-Carbon Wood Ash to Control Odor at a Green Materials Composting Facility. *Soil Science Society Annual Conferenc*e. Lecture conducted from Indianapolis, Maryland.

Rosenfeld. P.E. (September 16, 2000). Two stage biofilter for biosolids composting odor control. *Water Environment Federation.* Lecture conducted from Anaheim California.

Rosenfeld. P.E. (October 16, 2000). Wood ash and biofilter control of compost odor. *Biofest.* Lecture conducted from Ocean Shores, California.

Rosenfeld, P.E. (2000). Bioremediation Using Organic Soil Amendments. *California Resource Recovery Association*. Lecture conducted from Sacramento California.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. *Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings*. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., and C.L. Henry. (1999). An evaluation of ash incorporation with biosolids for odor reduction. *Soil Science Society of America*. Lecture conducted from Salt Lake City Utah.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Comparison of Microbial Activity and Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Brown and Caldwell.* Lecture conducted from Seattle Washington.

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest.* Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E, C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al.,, et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Email: mhagemann@swape.com

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Other Experience:

Selected as subject matter expert for the California Professional Geologist licensing examination, 2009-2011.

Letter No. O1
Jason A. Cohen
Southwest Mountain States Regional Council of Carpenters
c/o Mitchell M. Tsai
139 South Hudson Avenue, Suite 200
Pasadena, CA 91101

Response to Comment No. O1-1

The comment provides an introduction to the Southwest Regional Council of Carpenters (SWRCC) and submits comments for the City of Santa Clarita Planning Commission Meeting on April 18, 2023. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no response is warranted.

Response to Comment No. O1-2

The comment states that SWRCC reserves the right to supplement the comments during the review of the Final EIR for the Project and at the public hearings. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no response is warranted.

Response to Comment No. O1-3

The City will continue to send the SWRCC notices related to the Project. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O1-4

The comment provides research and opinions regarding the potential for the use of a local construction workforce to reduce greenhouse gas and air pollutant emissions as a result of reduced vehicle miles traveled by construction workers. Such research and opinions are noted. As concluded in the Draft EIR, the Project would not result in significant impacts related to greenhouse gas emissions or air quality. The comment also discusses the use of a local workforce and the City's imposition of training requirements during Project construction to prevent the spread of COVID-19 and other infectious diseases. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O1-5

The comment presents a draft technical report regarding local hire requirements and considerations for GHG modeling. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted. As noted in the prior response, the EIR concluded that the Project would not result in significant impacts related to greenhouse gas emissions or air quality.

Re: Request for Extension of Comment Period for the Draft Environmental Impact Report for Shadowbox Studios Project (Master Case 21-109) and Immediate Access to Reference Documents

Dear Mr. Crawford and Ms. Iverson:

We are writing on behalf of the Coalition for Responsible Equitable Economic Development in Los Angeles (CREED LA) to respectfully request that the City of Santa Clarita ("City") extend by at least 30 days the public review and comment period for the Draft Environmental Impact Report ("DEIR") prepared for the Shadowbox Studios Project (Master Case 21-109) ("Project"), which currently ends on May 22, 2023.

O2-1

We are requesting an extension due to the City's failure to provide timely access to all documents referenced in the DEIR. We ask that the City immediately comply with our April 27, 2023 request for immediate access to all documents referenced and incorporated by reference in the DEIR, including but not limited to (1) all documents referenced and incorporated by reference in the DEIR which are not available by weblink; (2) all unlocked native input files for CalEEMod modeling performed for the Project, as referenced in DEIR sections 4.2 and 4.7 and Appendix C; (3) any Excel file(s) prepared by Rincon Consultants, Inc. in connection with its

printed on recycled paper

air quality analysis and calculations for the Project; (4) missing documents referenced in DEIR section 4.14 and Appendix L, including Transportation Analysis Updates in Santa Clarita (May 19, 2020), Transportation Analysis Updates in Santa Clarita (June 20, 2023) and the Placerita Meadows EIR Traffic Study; (5) any reports or other documents reflecting an April 27, 2022 site visit by Michael Baker International, as referenced in Appendix D, pg. 18. **O2-1 Continued**

On April 27, 2023, our office submitted a request, pursuant to the California Environmental Quality Act ("CEQA"),[1] for immediate access to any and all *documents referenced or relied upon in the Draft Environmental Impact Report*, excluding the DEIR, its appendices and documents available on the City of Santa Clarita website as of that date.[2] CEQA's section 21092(b)(1) and CEQA Guidelines section 15087(c)(5) require that "all documents referenced" and "all documents incorporated by reference" in an environmental impact report shall be "readily accessible to the public during the lead agency's normal working hours" during the entire public comment period.[3]

On May 8, 2023, the City responded that it was "in receipt of your public records request," and that because the request involved numerous separate and distinct records, the City claimed an extension pursuant to Government Code section 7922.535(b) to provide the missing documents. The City stated that "pursuant to the extension provision, you will be contacted on or before May 22, 2023, with the availability of the records responsive and appropriate for disclosure." **O2-2**

As an initial matter, our April 27, 2023 request was made pursuant to the provisions of CEQA, not the California Public Records Act.[4] Therefore, the extension provision cited by the City (Government Code section 7922.535(b)) is inapplicable.

Moreover, CEQA compels a lead agency to make all documents referenced in an environmental impact report "available for review" during the entire public comment period.[5] The courts have held that the failure to provide even a few pages

[1] Pub. Resources Code §§ 21000 *et seq*.
[2] Letter to Jason Crawford and Erika Iverson, City of Santa Clarita from Sheila Sannadan, Adams Broadwell Joseph & Cardozo re: Request for Immediate Access to Documents Referenced in the Draft Environmental Impact Report – Shadowbox Studios Project (Master Case 21-109) (April 27, 2023).
[3] Pub. Resources Code § 21092(b)(1); 14 C.C.R. § 15087(c)(5).
[4] Government Code §§ 7920.000, *et seq*.
[5] Pub. Resources Code § 21092(b)(1); 14 C.C.R. § 15087(c)(5); *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442, as modified (Apr. 18, 2007).

printed on recycled paper

of a CEQA document for a portion of the public review period invalidates the entire CEQA process, and that such a failure must be remedied by permitting additional public comment.[6] It is also well settled that a CEQA document may not rely on hidden studies or documents that are not provided to the public.[7]

By failing to make all documents and underlying data referenced in the DEIR readily available during the entirety of the public comment period, the City is depriving members of the public the ability to meaningfully comment on the potentially significant environmental impacts of the Project and is violating the procedural mandates of CEQA. The City's suggestion that it will not make documents referenced in the DEIR available for our review until May 22, 2023—the last day to submit comments on the Project—plainly violates CEQA and would preclude any meaningful public review and comment. Therefore, we respectfully request that the City extend the public review and comment period on the DEIR by at least 30 days from the date on which the City releases ***all*** the DEIR reference documents for public review.

O2-2
Continued

Given the short time before the current public review and comment period ends, please contact me as soon as possible with your response to this request, but no later than close of business on **Monday, May 15, 2023**. Thank you for your consideration and prompt response to this request.

Sincerely,

Richard M. Franco

South San Francisco, CA 94080

Response to Comment No. O2-1

The comment requests an extension of the 45-day public review of the Draft EIR by at least 30 days. The City has provided the following public review periods and opportunities for public input during the Shadowbox Studios EIR process:

- Publication and distribution of a Notice of Preparation (NOP) on March 28, 2022, notifying interested agencies, organizations, and persons that the City would be preparing an EIR for the Project and inviting comments on the scope and content of the EIR. The public review period for the NOP was from March 29, 2022, to April 28, 2022.
- Public scoping meeting held on April 21, 2022, at which the City accepted comments on the scope and content of the EIR.
- Publication and distribution of a Notice of Completion and a Notice of Availability of the Draft EIR on April 6, 2023, which notified interested agencies, organization, and persons that the City was accepting comments on the Draft EIR. The public review period for the Draft EIR began on April 6, 2023, and ended on May 22, 2023.
- Three Planning Commission meetings held on April 18, 2023, May 16, 2023, and June 20, 2023, to solicit comments from the public and the Planning Commission on the Draft EIR.

The public review process undertaken by the City for the Draft EIR fully complies with all requirements of CEQA and the CEQA Guidelines. Given the above, and based on direction provided by the City's Planning Commission, the Draft EIR review period was not extended.

In addition, the City received a request on April 27, 2023, for access to all documents referenced and incorporated by reference in the Draft EIR, and a subsequent formal Public Records request was created in the City's Resident Service Center. The City is given 10 calendar days to respond to the request. Due to the numerous and distinct records that were being requested, staff required additional time to compile, review, and provide the records responsive to the request. A response was sent to the requestor on May 8, 2023, notifying them of this requirement under the provision of Government Code 7922.535(b), which allows for an additional 14 calendar days to respond. All referenced documents, along with links to online documents that were available, were provided on May 15, 2023, closing the Public Records request.

Response to Comment No. O2-2

The comment correctly states that CEQA and the CEQA Guidelines require a lead agency to make the Draft EIR and all documents incorporated by reference in the EIR available for public review. The City of Santa Clarita provided the Draft EIR, its appendices (Appendices A through O), and the documents incorporated by reference for public review during the entire review period, which extended from April 6, 2023, to May 22, 2023. Documents were made readily available on the City

of Santa Clarita website (see https://www.santa-clarita.com/city-hall/departments/community-development/planning and https://www.santa-clarita.com/city-hall/departments/community-development/planning-division/environmental-impact-reports-under-review/shadowbox-studios-project), as well as at the City Clerk's Office (in Santa Clarita City Hall) and at the Old Town Newhall Library. However, CEQA Guidelines Section 15148 also recognizes that the "preparation of EIRs is dependent upon information from many sources" and that "these documents should be cited but not included in the EIR." There is no requirement that all materials simply cited in an EIR be provided by the lead agency to potential reviewers throughout the entirety of the Draft EIR public review period.

PROPOSED SHADOWBOX STUDIOS PROJECT
(Master Case 21-109)

COMMENTS

Upon review of the proposed Shadowbox Studios Project, there are numerous issues of concern to the Sierra Club. According to the EIR, this proposed project is too large for the area with "476,000 square feet of sound stages, approximately 221,000 square feet of production and administrative office space, approximately 560,000 square feet of workshops, warehouses and support use buildings, and approximately 37,500 square feet of catering and other specialty services." A proposed studio of this size will bring thousands of people to an already congested area in our valley--each day and night! O3-1

Such a large studio complex in this neighborhood is also especially concerning due to the need for a major zoning change in a Special Standards District—an area protected for a reason. If the proposed project were to be allowed, serious flooding will undoubtedly happen upstream and increased traffic will occur. The site of this proposed project is in an area which not only floods, but is also a wildfire hazard area. There needs to be more concern for public safety with this project. Additionally, we do not approve of the proposed removal of a Significant Ridgeline and the removal of oak trees--one of which is a Grandmother Oak. Ultimately, the removal of a Special Standards District, the threat of flooding to upstream neighbors, the increase in traffic in an already congested area, and the potential loss of life (in an emergency) all point to the fact that this development project is flawed. O3-2

The multiple impacts this project will have on the surrounding neighborhoods both in the short and long-term make this project one we do not support. **The Sierra Club of the Santa Clarita Valley asks that you vote to deny the project unless these issues are ameliorated. Many in the community are in opposition to this project!** O3-3

- **Zoning Changes:**
  The Santa Clarita Sierra Club group is concerned about the location of the proposed Shadowbox Studios Project as it is set to negatively impact the rural equestrian Placerita Canyon Special Standards District. Changing the zoning designation is unacceptable, especially when there are other locations in the Santa Clarita Valley that the Studio could utilize without impacting such a unique and protected area. The purpose of a Special Standards District is to maintain, preserve, and enhance the rustic California ranch character of the area. We stand in opposition to projects that violate the neighborhood protections that have been and are still promised in the City's General Plan and Municipal Code for Special Standards Districts. O3-4

LETTER O3 Continued

- **Flooding/Hydrology:**

The proposed location of the Shadowbox Studios development is in a location where serious flooding occurs each time there is heavy rain. During significant rain storm events, there is normally no serious issue on-site as the water is able to disperse over the floodplain without obstruction. However, once developed, the water will have no place to go except back upstream and into the Placerita Canyon neighborhood. Should this riparian habitat be channelized, the potential for intense flooding would be directed onto those upstream. We can say this with certainty because of the high floodwaters that residents have seen each rainstorm. O3-5

Another concern is that the hydrological evaluation that was conducted in the EIR indicates that the Placerita "Creek" will be channelized and the natural floodway will be removed. Placerita's waterway is a natural creek and creek wash area. This area is a blue-line stream and the importance of preserving this waterway in its' natural state is critical. Placerita's blue-line stream should never be channelized with concrete. Encroaching on this important blue-line stream on **both** sides of its boundaries is not necessary and could be handled in a better way. Also, preserving the natural blue-line stream is critical to reducing the ever-present dangers of flooding in Placerita Canyon. It is important to mention that the flooding danger would not only affect the Placerita neighborhood, but that of the proposed studio complex, as well. O3-6

The planners of this project have counted on sending additional flood waters into Newhall Creek in a high precipitation event. However, in flooding situations, additional water cannot spill into Newhall Creek, as it will also be flooded. This leaves the runoff nowhere to go except to spread on the entire property and/or backup. This does not even include the possibility of future additional runoff from impervious surfaces. O3-7

- **Traffic/Air Pollution:**

If this proposed project is allowed to be constructed, employees of the proposed Shadowbox Studios Project will bring thousands of additional "car trips" per day onto our surface streets, thus increasing air pollution. Air pollution levels have already been exasperated in the last decade by increased annual wildfires in the Santa Clarita Valley. While the planner has provided some simple fixes for this busy area—one more lane each for ingress and egress at 13th St., and a roundabout (for example), things are rarely ever that simple. This is especially true when the reliability of the Draft EIR's traffic study has been called into question. The planners of this project have made proposed slight traffic changes, while dramatically increasing the car trips per day in the area. This is not going to result in a "better traffic" situation. That same logic has been used in other neighborhoods and has resulted in residents being stressed, air quality being worsened, and residents being put in danger when a wildfire threatens. Adding this proposed project where so many individuals/vehicles/trailers, etc. would O3-8

LETTER O3 Continued

converge (along with the projected increase number and frequency of trains) is an irreversible mistake.

O3-8 Continued

- **Public Safety:**

Another concern is the fact that this proposed studio is in a high-risk fire danger area. Portions of the Project site are designated as Very High Fire Hazard Severity Zones (VHFHSZ). Constructing twenty-three buildings (for use by many hundreds of people) in such a fire area, without adequate ingress/egress is potentially a life-threatening situation for studio employees and residents alike. This fire hazard is not hypothetical. In 2016, as reported by SCVnews.com, "residents were stuck in their neighborhood" during the evacuations from the nearby Sand Fire (another area lacking enough egress/ingress) which burned 41,432 acres.

O3-9

During fires, the nearby freeway has been clogged with traffic and shut down due to accidents on a fairly regular basis. One of our more recent fires made it impossible for people to rapidly exit the valley using the freeway and the surface streets, including The Old Road and Newhall Avenue/Railroad Avenue. Traffic was brought to a crawl for hours. This project will have two means of ingress/egress, both of which connect directly to Railroad Avenue/Newhall Avenue. Residents of Placerita Canyon may have no means of escape when a very large fire occurs in the area, which experience tells us it will. The presence of a fire station on the site will have little impact when another fire roars through this area.

Interestingly enough, the EIR actually agrees with our concerns, stating: "The LOS evaluation described above shows that the limited capacity of the roundabout design could cause operational problems if traffic increases to the point that the roundabout operates as if it were under all-way stop control. In the event of an evacuation of the canyon, the traffic increases would push the roundabout operations into stop sign performance conditions. Thus, under evacuation conditions, the capacity limitations of the roundabout would result in failure of the roundabout design, increasing the time needed to maneuver through the roundabout and extending the line of cars queuing back toward the canyon, both of which are detrimental to the evacuation process."

O3-10

Emergency traffic concerns are compounded by the need to evacuate large animals with horse trailers. Both the additional number and size of the vehicles would further clog the streets.

Sierra Club is extremely concerned about the lasting damage to this canyon and the surrounding areas. We are strongly opposed to any building in an SEA. We are strongly opposed to building in a Very High Fire Hazard Severity Zone. Should this project be approved, it would be critical for the planners to use permeable asphalt whenever possible. Also, additional filtration and infiltration facilities would be needed to effectively handle water during flood events.

O3-11

LETTER O3 Continued

CONCLUSION

Sierra Club is concerned that if the proposed Shadowbox Studios Project development plan is approved it will permanently degrade the nature and character of Placerita Canyon (a Special Standards District area), destroy land that helps provide a place for floodwaters during periods of significant rainstorm events, and endanger people's lives and property. The removal of ancient oaks and a Significant Ridgeline along with the destruction of the natural floodway and channelization of a blue-line stream is unnecessary. These cumulative impacts, along with the cumulative impacts of additional traffic from the studio, additional proposed nearby building, along with the new traffic pattern of Dockweiller spilling an additional 10,000 car trips/day into the mix, should be taken into serious consideration. The Sierra Club requests that SCV Planning Commission denies approval of the Shadowbox Project unless our issues are ameliorated.

O3-12

Thank you for your consideration and time in reviewing our concerns.

Sincerely,

Sandra Cattell
Chair
Sierra Club, Santa Clarita Valley Group

Letter No. O3
Sandra Cattell, Chair
Sierra Club, Santa Clarita Valley Group
3250 Wilshire Boulevard, Suite 1106
Los Angeles, CA 90010

Response to Comment No. O3-1

The comment states that the Sierra Club has numerous issues of concern regarding the Project. The comment also states that "According to the EIR, this proposed project is too large for the area…" It should be noted that the Draft EIR made no such assertion. The comment expresses the opinions of the commenter but does not address the adequacy of the Draft EIR. Accordingly, the comment is noted and will be forwarded to the decision-makers for consideration. No additional response is warranted.

Response to Comment No. O3-2

The comment expresses concern due to the Project's zone change request in a Special Standards District. The comment asserts that the Project would result in serious flooding, increased traffic, public safety issues due to the Project Site's location in a wildfire hazard area, the removal of a Significant Ridgeline, the removal of oak trees, and the potential loss of life in an emergency. It should be noted that the Project would not result in the removal of the Project Site from the Placerita Canyon Special Standards District (PCSSD). As discussed in Section 4.10, Land Use and Planning, of the Draft EIR, the Project would be required to undergo multiple City reviews to ensure that the Project complies with the requirements of the PCSSD. Moreover, the Project would not result in the removal of a Significant Ridgeline. As discussed in Section 4.10, the Project would not disturb the area beyond the base of the ridgeline north of Placerita Creek and would maintain the ridgeline as natural open space. Additionally, the Project would remove 13 oak trees, which would require an oak tree permit for the encroachment into the protected zone. The Project would comply with the permit requirements, which may include the relocation of impacted oak trees on- or off-site to offset the loss of trees. A total of 211 oak trees and 450 trees of different non-oak varieties are proposed to be planted throughout the Project Site. It is unclear what the commenter's reference to a "Grandmother Oak" is referring to, as the term "Grandmother Oak" is not a term used in the City's Oak Tree Preservation Ordinance (Santa Clarita Municipal Code Section 17.17.090) or otherwise defined by scientific methodology. Project impacts related to flooding, traffic, and wildfire are addressed in Sections 4.9, Hydrology and Water Quality, 4.14, Transportation, and 4.17, Wildfire, of the Draft EIR, respectively. Public safety issues related to emergency evacuation are addressed in Sections 4.8, Hazards and Hazardous Materials, and 4.17, Wildfire, of the Draft EIR. As concluded in the Draft EIR, impacts related to these issues of concern would be less than significant. The comment does not provide any evidence to the contrary, and no additional response is warranted.

Response to Comment No. O3-3

The comment states that many community members are opposed to the Project and requests that the City deny the Project due to the multiple short and long-term impacts that the Project will have on the surrounding neighborhoods. The comment does not specify the impacts or address the adequacy of the Draft EIR. Accordingly, the comment is noted and will be forwarded to the decision-makers for consideration. No additional response is warranted.

Response to Comment No. O3-4

The comment expresses concern over the location of the Project within the PCSSD and how the requested zone change would impact the area. The zone change request for the northern portion of the Project Site from NU5 to MXN would have no impact on the Project's requirement to comply with the applicable development standards of the PCSSD. As discussed in Section 4.10, Land Use and Planning, of the Draft EIR, the Project would undergo multiple City review processes to ensure that the Project would be compatible with the existing rural, rustic California ranch character of the surrounding area in accordance with the PCSSD. The analysis in Section 4.10 of the Draft EIR concluded that the Project would be consistent with the City's General Plan, Santa Clarita Municipal Code, and with the PCSSD development standards. The comment does not specify the impacts or address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O3-5

The comment expresses concern that development of the Project would result in flooding upstream. Based on the Hydraulic Report, which analyzed both the existing and developed conditions for the creek drainage, flooding would not occur on the Project Site or upstream properties as a result of the Project. The proposed drainage basin located in the far northwest corner, west of the north parking lot, within the Project Site would detain stormwater during significant rain events. The proposed underground infiltration chambers/drainage basin would capture the 85th percentile, which equates to the first ¾ inch of rainfall in all rain events.[10] As discussed in Section 4.9, Hydrology and Water Quality, of the Draft EIR, the Project would allow for stormwater to be contained and treated on-site prior to being released to Placerita Creek, ensuring that stormwater runoff rates and volumes do not result in flooding on-site or off-site due to Project implementation.

Response to Comment No. O3-6

The comment expresses concern that the Project would channelize Placerita Creek with concrete and remove a natural floodway. The Project is proposing buried rock bank stabilization and not concrete as stated in the comment. Bank protection on both sides of Placerita Creek is necessary to prevent erosion and maintain the flow within the creek. Refer to the Hydraulic Report prepared for the Project, which analyzed the existing and developed conditions for the creek and concludes that there is no adverse impact to the Project Site or upstream properties.

Response to Comment No. O3-7

The comment claims that the Project would send additional flood waters into Newhall Creek in a high precipitation event. Newhall Creek is located downstream of Placerita Creek on the westerly side of Railroad Avenue. The Hydraulic Report prepared for the Project analyzed both the existing and developed conditions for the creek drainage and concludes that there is no downstream impact to the Newhall Creek. Furthermore, the proposed drainage basin within the Project Site would capture and detain stormwater runoff during significant rain events. The proposed underground filtration chambers/drainage basin would capture the first ¾ inch of rainfall in all rain events. The calculation for the ¾-inch treatment volume is determined by the 85th percentile storm which equates to ¾-inch of rainfall. As discussed in Section 4.9, Hydrology and Water

[10] Alliance Land Planning and Engineering, Craig M. Whitteker, PE 51929, USMP/LID Report, May 12, 2023.

Quality, of the Draft EIR, the Project would allow for stormwater to be contained and treated on-site prior to being released to Placerita Creek, ensuring that stormwater runoff would not substantially increase and spread across the Project Site or backup as a result of Project implementation.

Response to Comment No. O3-8

The comment asserts that Project would result in thousands of additional car trips, which would increase air pollution levels in the Santa Clarita Valley. The comment also questions the reliability of the Draft EIR's traffic study but does not provide specific reasons or provide substantial evidence that the traffic study is inadequate. Pursuant to Senate Bill 743, the primary metric to evaluate transportation is now vehicle miles traveled (VMT), as referenced in Appendix G of the CEQA Guidelines. Although the Project would generate additional vehicle trips, the Project would generate an average home-based work VMT per employee of 14.0, which is less than the City's threshold of significance of 15.7. Therefore, as evaluated in Section 4.14, Transportation, of the Draft EIR, impacts would be less than significant without mitigation. Additionally, the analysis in Section 4.2, Air Quality, of the Draft EIR determined that the Project's air quality impacts would be less than significant without mitigation based on a quantified evaluation of Project-generated air emissions as compared with the thresholds of significance established by the South Coast AQMD.

Response to Comment No. O3-9

The comment states that the Project Site is located in a Very High Fire Hazard Severity Zone (VHFHSZ) and that a potentially life-threatening situation could occur during a large fire event without adequate ingress/egress. As discussed in Section 4.17, Wildfire, of the Draft EIR, the Project would utilize several exits in the event of a fire evacuation, including the main entrance and two other access-controlled gates, one located immediately east of the main entrance at the eastern leg of the intersection of Arch Street and 13th Street, and one along 12th Street immediately east of the proposed catering buildings. In addition, a traffic evacuation assessment was conducted to analyze the off-site improvements proposed by the Project, without and with the Dockweiler Drive Extension Project, which demonstrated that the Project roadway improvements would facilitate the evacuation of the Placerita Canyon area by reducing the evacuation congestion period at Arch Street and 12th Street and Dockweiler Drive. The traffic signal intersection design would provide for the most efficient traffic operations under an evacuation scenario. Therefore, as concluded in Section 4.17, the Project would not substantially impair an adopted emergency response plan or emergency evacuation plan, and impacts would be less than significant.

Response to Comment No. O3-10

The comment correctly quotes the key evacuation consideration from page 81 of the Project's Transportation Assessment, which was included as Appendix L of the Draft EIR. However, the comment omits the fact that a traffic evaluation assessment was conducted for the Placerita Canyon Area to measure the anticipated performance of Dockweiler Drive, Arch Street, and 13th Street in the event of an emergency evacuation under Existing Conditions and Future with Project Conditions. The results of the assessment are summarized on page 85 of the Project's Transportation Assessment, which concluded that the off-site improvements proposed by the Project would reduce the evacuation congestion period that would be experienced under existing conditions. The full

traffic evacuation assessment is provided in Appendix N of the Draft EIR. This comment does not specify the impacts or address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O3-11

The comment states the Sierra Club's concern about the damage that the Project would cause to the canyon and surrounding areas and expresses opposition to building in a Significant Ecological Area (SEA) and VHFHSZ. To clarify, as discussed on page 4.3-24, in Section 4.3, Biological Resources, of the Draft EIR, the Project Site is not within an SEA. The comment also states that permeable asphalt and additional filtration and infiltration facilities should be implemented to address flooding. Please see Response to Comment Nos. O3-5 through O3-7, which address flooding on the Project Site and surrounding area. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O3-12

The comment summarizes Sierra Club's concern that the Project would permanently degrade the nature and character of Placerita Canyon and result in the removal of oaks and a significant ridgeline, the destruction of the natural floodway, the channelization of a blue-line stream, and cumulative traffic impacts. To clarify, as noted in the prior responses above, the Project would undergo multiple City review processes to ensure that the Project would be compatible with the existing rural, rustic California ranch character of the surrounding area in accordance with the PCSSD; the Project would not disturb the area beyond the base of the ridgeline north of Placerita Creek and would maintain the ridgeline as natural open space; and the Project is proposing buried rock bank stabilization rather than concrete channelization. The comment reiterates Sierra Club's request for the City to deny the Project unless these concerns are addressed. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Re: Comment on Draft Environmental Impact Report, Shadowbox Studios Project (SCH 2022030762)

Dear Ms. Iverson:

This comment is submitted on behalf of Supporters Alliance for Environmental Responsibility ("SAFER") regarding the Draft Environmental Impact Report ("DEIR") prepared for the Shadowbox Studios Project (SCH 2022030762), which proposes the construction of a film and television studio campus consisting of approximately 473,000 square feet of sound stages; approximately 561,500 square feet of workshops, warehouses, and support uses; and approximately 221,000 square feet of production and administrative offices, located at Railroad Avenue and 13th Street in the City of Santa Clarita ("Project").

O4-1

SAFER is concerned that the DEIR fails as an informational document and that it fails to impose all feasible mitigation measures to reduce the Project's significant environmental impacts. SAFER requests that the Community Development Department address these shortcomings in a revised draft environmental impact report ("RDEIR") and recirculate the RDEIR prior to considering approvals for the Project.

SAFER reserves the right to supplement these comments during the administrative process. *Galante Vineyards v. Monterey Peninsula Water Management Dist.*, 60 Cal. App. 4th 1109, 1121 (1997).

Sincerely,

Richard Drury

Oakland, CA 94612

Response to Comment No. O4-1

The comment expresses concern that the Draft EIR failed as an informational document and fails to impose all feasible mitigation measures to reduce the Project's impact but provides no specific evidence to support these claims. The comment requests the City address the shortcomings in a revised Draft EIR and recirculate prior to approval. The comment states it reserves the right to supplement the comments during the administrative process. Overall, the comment does not identify any specific shortcomings of the Draft EIR analysis or mitigation measures. Accordingly, no specific response is required. Furthermore, the Draft EIR fully complied with all of CEQA's mandates, and the comment presents no information or substantial evidence about any specific impact area and, as such, does not present any information that meets any of the criteria for recirculation of the Draft EIR. The comment is noted for the record and will be forwarded to the decision-makers for review and consideration.

RE: City of Santa Clarita's Shadowbox Studios DEIR Comment Letter

Dear Erika Iverson,

On behalf of the Southwest Mountain States Regional Council of Carpenters ("**Southwest Carpenters**" or "**SWMSRCC**"), our office is submitting these comments for the City of Santa Clarita's (the "**City**") Shadowbox Studios project (the "**Project**").

The Southwest Carpenters is a labor union representing over 57,000 union carpenters in six states, including California, and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects.

Individual members of the Southwest Carpenters live, work, and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts. **O5-1**

The Southwest Carpenters expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. California Government Code ("**Gov. Code**") § 65009, subd. (b); Public Resources Code ("**Pub. Res. Code**") § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

The Southwest Carpenters incorporates by reference all comments raising issues regarding the DEIR (the "**DEIR**") submitted prior to certification of the EIR for the Project. See *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal.App.4th 173, 191

(finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

Moreover, the Southwest Carpenters requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act ("**CEQA**") (Pub. Res. Code, § 21000 *et seq.*), and the California Planning and Zoning Law ("**Planning and Zoning Law**") (Gov. Code, §§ 65000–65010). Pub. Res. Codes §§ 21092.2, and 21167(f) and Gov't Code § 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY'S ECONOMIC DEVELOPMENT AND ENVIRONMENT

The City should require the Project to be built using a local workers who have graduated from a Joint Labor-Management Apprenticeship Program approved by the State of California, have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a state-approved apprenticeship training program, or who are registered apprentices in a state-approved apprenticeship training program.

O5-1
Continued

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board

and the University of California, Berkeley Center for Labor Research and Education concluded:

> [L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

Furthermore, workforce policies have significant environmental benefits given that they improve an area's jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas ("**GHG**") emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District found that that the "[u]se of a local state-certified apprenticeship program" can result in air pollutant reductions.[2]

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 ("**AB2011**"). AB2011 amended the Planning and Zoning Law to

O5-1
Continued

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[3]

---

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf.

[2] South Coast Air Quality Management District (May 7, 2021) Certify Final Environmental Assessment and Adopt Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305, Submit Rule 2305 for Inclusion Into the SIP, and Approve Supporting Budget Actions, *available at* http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-May7-027.pdf?sfvrsn=10.

[3] California Planning Roundtable (2008) Deconstructing Jobs-Housing Balance at p. 6, *available at* https://cproundtable.org/static/media/uploads/publications/cpr-jobs-housing.pdf

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled (VMT). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.[4] Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

O5-1 Continued

Therefore, the City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

II. THE PROJECT WOULD BE APPROVED IN VIOLATION OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

A. Background Concerning the California Environmental Quality Act

CEQA has two basic purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 California Code of Regulations ("**CCR**" or "**CEQA Guidelines**") § 15002(a)(1). "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.' [Citation.]" *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564. The EIR has been described as

O5-2

[4] Cervero, Robert and Duncan, Michael (2006) Which Reduces Vehicle Travel More: Jobs-Housing Balance or Retail-Housing Mixing? Journal of the American Planning Association 72 (4), 475-490, 482, *available at* http://reconnectingamerica.org/assets/Uploads/UTCT-825.pdf.

"an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs.* (2001) 91 Cal. App. 4th 1344, 1354 ("Berkeley Jets"); *County of Inyo v. Yorty* (1973) 32 Cal.App.3d 795, 810.

Second, CEQA directs public agencies to avoid or reduce environmental damage when possible by requiring alternatives or mitigation measures. CEQA Guidelines § 15002(a)(2) and (3). *See also, Berkeley Jets,* 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553; *Laurel Heights Improvement Ass'n v. Regents of the University of California* (1988) 47 Cal.3d 376, 400. The EIR serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines § 15002(a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in CEQA section 21081. CEQA Guidelines § 15092(b)(2)(A–B).

O5-2
Continued

B. The City Should Prepare an EIR for the Project

A strong presumption in favor of requiring preparation of an EIR is built into CEQA. This presumption is reflected in what is known as the "fair argument" standard, under which an agency must prepare an EIR whenever substantial evidence in the record supports a fair argument that a project may have a significant effect on the environment. *Quail Botanical Gardens Found., Inc. v City of Encinitas* (1994) 29 CA4th 1597, 1602; *Friends of "B" St. v City of Hayward* (1980) 106 Cal.App.3d 988, 1002.

The fair argument test stems from the statutory mandate that an EIR be prepared for any project that "may have a significant effect on the environment." Pub Res C §21151; *No Oil, Inc. v City of Los Angeles* (1974) 13 C3d 68, 75; *Jensen v City of Santa Rosa* (2018) 23 CA5th 877, 884. Under this test, if a proposed project is not exempt and *may* cause a significant effect on the environment, the lead agency *must* prepare an EIR. Pub Res C §§21100(a), 21151; 14 Cal Code Regs §15064(a)(1), (f)(1). An EIR may be dispensed with only if the lead agency finds no substantial evidence in the initial study or elsewhere in the record that the project may have a significant effect on the environment. *Parker Shattuck Neighbors v Berkeley City Council* (2013) 222 CA4th 768,

O5-3

785. In such a situation, the agency must adopt a negative declaration. Pub Res C §21080(c)(1); 14 Cal Code Regs §§15063(b)(2), 15064(f)(3).

"Significant effect upon the environment" is defined as "a substantial or potentially substantial adverse change in the environment." Pub Res C §21068; 14 Cal Code Regs §15382. See §13.2. A project "may" have a significant effect on the environment if there is a "reasonable probability" that it will result in a significant impact. *No Oil, Inc. v City of Los Angeles,* 13 C3d at 83 n16; *Sundstrom v County of Mendocino* (1988) 202 CA3d 296, 309. If any aspect of the project may result in a significant impact on the environment, an EIR must be prepared even if the overall effect of the project is beneficial. 14 Cal Code Regs §15063(b)(1). See *County Sanitation Dist. No. 2 v County of Kern* (2005) 127 CA4th 1544, 1580.

O5-3
Continued

This standard sets a "low threshold" for preparation of an EIR. *Consolidated Irrig. Dist. v City of Selma* (2012) 204 CA4th 187, 207; *Nelson v County of Kern* (2010) 190 CA4th 252; *Pocket Protectors v City of Sacramento* (2004) 124 CA4th 903, 928; *Bowman v City of Berkeley* (2004) 122 CA4th 572, 580; *Citizen Action to Serve All Students v Thornley* (1990) 222 CA3d 748, 754; *Sundstrom v County of Mendocino* (1988) 202 CA3d 296, 310. If substantial evidence in the record supports a fair argument that the project may have a significant environmental effect, the lead agency must prepare an EIR even if other substantial evidence before it indicates the project will have no significant effect. See *Jensen v City of Santa Rosa* (2018) 23 CA5th 877, 886; *Clews Land & Livestock v City of San Diego* (2017) 19 CA5th 161, 183; *Stanislaus Audubon Soc'y, Inc. v County of Stanislaus* (1995) 33 CA4th 144, 150; *Brentwood Ass'n for No Drilling, Inc. v City of Los Angeles* (1982) 134 CA3d 491; *Friends of "B" St. v City of Hayward* (1980) 106 CA3d 988. See also 14 Cal Code Regs §15064(f)(1).

C. <u>CEQA Requires Revision and Recirculation of an Environmental Impact Report When Substantial Changes or New Information Comes to Light</u>

To afford the public an opportunity to review and comment on an EIR, "[w]hen significant new information is added to an environmental impact report after notice has been given pursuant to Section 21092 … but prior to certification, the public agency shall give notice again pursuant to PRC § 21092, and consult again pursuant to Sections 21104 and 21153 before certifying the environmental impact report" in accordance with PRC § 21092.1. CCR § 15088.5.

O5-4

Significant new information includes "changes in the project or environmental

setting as well as additional data or other information" that "deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative)." CCR § 15088.5(a). Examples of significant new information requiring recirculation include "new significant environmental impacts from the project or from a new mitigation measure," "substantial increase in the severity of an environmental impact," "feasible project alternative or mitigation measure considerably different from others previously analyzed" as well as when "the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." *Id.*

O5-4 Continued

An agency has an obligation to recirculate an environmental impact report for public notice and comment due to "significant new information" regardless of whether the agency opts to include it in a project's environmental impact report. *Cadiz Land Co. v. Rail Cycle* (2000) 83 Cal.App.4th 74, 95 [finding that in light of a new expert report disclosing potentially significant impacts to groundwater supply "the EIR should have been revised and recirculated for purposes of informing the public and governmental agencies of the volume of groundwater at risk and to allow the public and governmental agencies to respond to such information."]. If significant new information was brought to the attention of an agency prior to certification, an agency is required to revise and recirculate that information as part of the environmental impact report.

Based on the arguments set forth below, in the alternative, the Carpenters request that the City recirculate the DEIR upon making any revisions due to significant new information.

D. The DEIR Improperly Labels Mitigation Measures as "Project Design Features"

O5-5

The DEIR improperly labels mitigation measures as a "Project Design Features" or "PDFs" throughout the DEIR, and which the DEIR purports to use in assessing regulatory requirements in the DEIR and consistently conflates them with mitigation. The DEIR then provides a disclaimer that the PDFs are not to mitigate impacts:

> Project Design Features As applicable, the Project Design Features subsection identifies components of the Project that would be implemented above and beyond compliance with specific regulations

> and requirements but not for the purpose of mitigating the Project's significant impacts (e.g., provision of rooftop photovoltaic systems and solar panels not required by the Santa Clarita Municipal Code).

O5-5 Continued

DEIR, 4.0-2

And yet, the DEIR's disclaimer is inaccurate; its use of the PDF is similarly improper.

For example, the DEIR provides for PDFs for air quality, stating:

> PDF-AQ-1: The Project will operate off-road diesel-powered construction equipment to meet or exceed CARB and USEPA Tier 3 off-road emissions standards with Level 3 diesel particulate filters or be alternatively (non-diesel) fueled to reduce diesel exhaust emissions.
>
> PDF-AQ-2: Off-road diesel-powered construction equipment will meet or exceed the CARB and USEPA Tier 3 off-road emissions standards and be equipped with Level 3 diesel particulate filters at a minimum.

(DEIR, 4.2-18.)

As shown in this example, what the DEIR calls a PDF is actually a mitigation measure to reduce construction-related air quality impacts. For example, while the DEIR concludes that the Project's air quality impacts will be less than significant, it does nonetheless rely, at least in part, on the PDFs, stating:

O5-6

> "In addition, the Project includes Project Design Features PDF-AQ-1 and PDF-AQ-2, identified in Subsection 4.2.5, Project Design Features, above, to ensure that only off-road diesel-powered equipment with proper particulate filers are used on-site, which would further reduce DPM emissions.

(DEIR, p. 4.2-22.)

It is also noteworthy that the DEIR's PDF does not propose the more stringent Tier 4 off-road emission standards but rather Tier 3 ones. Yet, Tier 4 has long been known to be more protective of the environment by the EPA.[5], [6]

The City's conclusion in the DEIR that the Project would have no air quality impacts, including due to PDFs, is also flawed since it only looks at the residential uses nearby.

O5-7

[5] https://axi-international.com/epa-tier-engine-emissions-standards-explained/
[6] EPA rule re Tier 4, available at: https://www.govinfo.gov/content/pkg/FR-2004-06-29/pdf/04-11293.pdf

(DEIR, p. 4.2-21.) Yet, the DEIR elsewhere explains that the Project is surrounded by other non-residential uses as well, which – contrary to the DEIR's assertions – may nonetheless have sensitive receptors:

> SENSITIVE RECEPTORS
>
> Sensitive receptors are a land use associated with persons of a population that are more susceptible to the effects of air pollution than the general population. Sensitive receptors that are in proximity to localized sources of TACs and CO are of particular concern. The following population groups are most likely to be adversely affected by air pollution, as identified by the California Air Resources Board (CARB): children under 14, elderly over 65, athletes, and people with cardiovascular and chronic respiratory diseases. Land uses that **may** contain a high concentration of these sensitive population groups **include residential** areas, **hospitals**, **day-care** facilities, **elder-care** facilities, elementary **schools**, and **parks**.

O5-7
Continued

(DEIR, p. 4.2-6, emph. added.)

But see, the DEIR's subsequent admission about other sensitive receptors nearby:

> There are **two churches** in the general Project vicinity, Newhall Christian Church, approximately 300 feet to the east, and Village Church, approximately 525 feet to the west of the Project Site. However, these uses would not have direct line-of-sight to the Project Site due to intervening structures, consisting of residential or commercial uses. Likewise, **nearby schools**, including Placerita Junior High School, Hart High School, Newhall Elementary School, and the Master's University, are also shielded by intervening commercial and residential uses and are located more than 900 feet from the Project Site.

(DEIR, p. 4.11-4, emph. added.)

As such, by labeling the air quality mitigation measure as PDFs, the DEIR removes those from scrutiny as to whether those PDFs are the most effective to reduce air quality impacts. Similarly, by omitting critical sensitive receptors at churches and schools and by only focusing on the residential areas, the DEIR further understates the air quality impacts to conclude that those would be less than significant. The DEIR's

conclusions as to the PDFs and the air quality impacts, therefore, are inaccurate and unsupported. O5-7 Continued

Similarly, the DEIR relies on PDFs for purposes of impacts of public services, stating:

> PDF-PUB-1: All buildings shall be accessible to LACoFD apparatus by way of access roadways, with an all-weather surface of not less than 28 feet in width. The **roadway shall** be **extended** to within 150 feet of all portions of the exterior walls when measured by an unobstructed route along the exterior of the building. The roadway shall provide approved signs and/or striping stating "No Parking – Fire Lane" and shall be maintained in accordance with the Los Angeles County Fire Code.

(DEIR, p. 4.13-8, emph. added.) O5-8

The DEIR then uses this PDF to conclude that the Project would have adequate fire access and therefore no potential for fire impacts. (DEIR, p. 4.13-10.)

And yet, as shown above, the PDF proposes to extend the roadway, which in and of itself may have impacts on the environment. However, because it is called as a PDF and not a mitigation measure, it escapes scrutiny of whether the PDF will be in fact feasible, or whether it will not have impacts of its own.

And again, the City's DEIR uses PDFs for traffic mitigation purposes, stating in part:

> PDF-TA-1: The Project will incorporate several Transportation Demand Measures (TDM) features to contribute to the reduction in VMT and vehicle trips to and from the Project Site. These actions are consistent with City and State of California transportation and GHG policies and objectives. The following measures will be incorporated into the Project to reduce VMT and vehicle trips: O5-9
>
> • Flexible work schedules and telecommuting programs
>
> • **Bicycle amenities** (bicycle racks, lockers, showers, etc.)
>
> • **Carpool** programs and support
>
> • Tenant-based guaranteed **ride home** (GRH) program
>
> • Flex car support

- Preferential parking locations for high-occupancy vehicles
- TDM promotions and marketing
- Pedestrian network improvements
- **On-street bicycle facilities**
- Bicycle parking per Santa Clarita Unified Development Code

(DEIR, p. 4.14-12, emph. added.)

O5-9
Continued

Only later, the DEIR discloses: "Consistent. The Project proposes to include a **bicycle path on 13th Street**, as well as **upgrades** to the **intersection of 13th Street** and **Arch Street** to provide and **enhance the multimodal circulation** in the Project area." (DEIR, p. 4.14-13, emph. added.)

Here too, because the DEIR labels various traffic mitigation measures as merely PDFs, they avoid scrutiny of whether those measures would be efficient or whether they will not have impacts of their own in need of mitigation. As an example here, the PDF proposing bicycle facilities, and more precisely, a bicycle path on the 13th street, or carpool programs or ride homes may not necessarily prove to be effective or feasible. Besides, those may have their own impacts on the environment. These issues are not studied or addressed in the DEIR only because these improvements are listed as PDFs and not mitigation measures.

The above-noted observations are applicable to the DEIR's PDFs to mitigate wildfire risk and hazards. (DEIR, p. 4.17-10.)

However, it is established that "'[a]voidance, minimization and / or mitigation measure' . . . are not 'part of the project.' . . . compressing the analysis of impacts and mitigation measures into a single issue . . . disregards the requirements of CEQA." *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 656.

O5-10

When "an agency decides to incorporate mitigation measures into its significance determination, and relies on those mitigation measures to determine that no significant effects will occur, that agency must treat those measures as though there were adopted following a finding of significance." *Lotus*, supra, 223 Cal.App.4th at 652 [citing CEQA Guidelines § 15091(a)(1) and PRC § 21081(a)(1).

By labeling mitigation measures as project design features, the City violates CEQA by failing to disclose "the analytic route that the agency took from the evidence to its

findings." PRC § 21081.5; CEQA Guidelines § 15093; *Village Laguna of Laguna Beach, Inc. v. Board of Supervisors* (1982) 134 Cal.App.3d 1022, 1035 (*citing Topanga Assn for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 515).

The DEIR's use of this PDF further violates CEQA because such measures would not be included in the Project's Mitigation Monitoring and Reporting Program CEQA requires lead agencies to adopt mitigation measures that are fully enforceable and to adopt a monitoring and/or reporting program to ensure that the measures are implemented to reduce the Project's significant environmental effects to the extent feasible. PRC § 21081.6; CCR § 15091(d). **O5-10 Continued**

Therefore, using Project Design Features in lieu of mitigation measures violates CEQA. The City should revise and recirculate its EIR in light of the noted new and significant information showing that the PDFs themselves may have impacts and the Project's impacts may be understated and actually more severe than disclosed.

E. The DEIR Fails to Support Its Findings with Substantial Evidence

When new information is brought to light showing that an impact previously discussed in the DEIR but found to be insignificant with or without mitigation in the DEIR's analysis has the potential for a significant environmental impact supported by substantial evidence, the DEIR must consider and resolve the conflict in the evidence. (See *Visalia Retail, L.P. v. City of Visalia* (2018) 20 Cal. App. 5th 1, 13, 17; see also *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal. App. 4th 1099, 1109.) While a lead agency has discretion to formulate standards for determining significance and the need for mitigation measures—the choice of any standards or thresholds of significance must be "based to the extent possible on scientific and factual data and an exercise of reasoned judgment based on substantial evidence. (CEQA Guidelines § 15064(b); *Cleveland Nat'l Forest Found. v. San Diego Ass'n of Gov'ts* (2017) 3 Cal. App. 5th 497, 515; *Mission Bay Alliance v. Office of Community Inv. & Infrastructure* (2016) 6 Cal. App. 5th 160, 206.) And when there is evidence that an impact could be significant, an EIR cannot adopt a contrary finding without providing an adequate explanation along with supporting evidence. (*East Sacramento Partnership for a Livable City v. City of Sacramento* (2016) 5 Cal. App. 5th 281, 302.) **O5-11**

In addition, a determination that regulatory compliance will be sufficient to prevent significant adverse impacts must be based on a project-specific analysis of potential impacts and the effect of regulatory compliance. In *Californians for Alternatives to Toxics v.*

Department of Food & Agric. (2005) 136 Cal.App.4th 1, the court set aside an EIR for a statewide crop disease control plan because it did not include an evaluation of the risks to the environment and human health from the proposed program but simply presumed that no adverse impacts would occur from use of pesticides in accordance with the registration and labeling program of the California Department of Pesticide Regulation. *See also Ebbetts Pass Forest Watch v Department of Forestry & Fire Protection* (2008) 43 Cal.App.4th 936, 956 (fact that Department of Pesticide Regulation had assessed environmental effects of certain herbicides in general did not excuse failure to assess effects of their use for specific timber harvesting project).

O5-11
Continued

1. *The DEIR Fails to Supports its Findings on Greenhouse Gas Impacts with Substantial Evidence.*

CEQA Guidelines § 15064.4 allow a lead agency to determine the significance of a project's GHG impact via a qualitative analysis (e.g., extent to which a project complies with regulations or requirements of state/regional/local GHG plans), and/or a quantitative analysis (e.g., using model or methodology to estimate project emissions and compare it to a numeric threshold). So too, CEQA Guidelines allow lead agencies to select what model or methodology to estimate GHG emissions so long as the selection is supported with substantial evidence, and the lead agency "should explain the limitations of the particular model or methodology selected for use." CEQA Guidelines § 15064.4(c).

O5-12

CEQA Guidelines sections 15064.4(b)(3) and 15183.5(b) allow a lead agency to consider a project's consistency with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

CEQA Guidelines §§ 15064.4(b)(3) and 15183.5(b)(1) make clear qualified GHG reduction plans or CAP should include the following features:

(1) **Inventory**: Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities (e.g., projects) within a defined geographic area (e.g., lead agency jurisdiction);

(2) **Establish GHG Reduction Goal**: Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;

(3) **Analyze Project Types**: Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;

(4) **Craft Performance Based Mitigation Measures**: Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;

(5) **Monitoring**: Establish a mechanism to monitor the CAP progress toward achieving said level and to require amendment if the plan is not achieving specified levels;

Collectively, the above-listed features tie qualitative measures to quantitative results, which in turn become binding via proper monitoring and enforcement by the jurisdiction—all resulting in real GHG reductions for the jurisdiction as a whole, and the substantial evidence that the incremental contribution of an individual project is not cumulatively considerable. **O5-12 Continued**

Second, it is not enough for an environmental document to conclude there is no significant GHG emissions impacts based upon a determination of consistency with a GHG Reduction Plan, without also making a determination based upon substantial evidence of the project's actual cumulative contributions to GHG emissions. In other words, a determination of consistency is only a starting point.[7] Compliance or non-compliance is merely one factor to be considered. The lead agency must explain how reliance on any particular plan or regulation addresses a potential impact.

The DEIR, among other statements, asserts: "Moreover, the Project would reduce VMT and energy demand, thereby reducing GHG emissions, by constructing a large employment generator in a housing-rich area of the SCAG region..." (DEIR, p. 4.7-14.)

To be clear, the Project, as the DEIR describes, is massive and is proposed on undeveloped land: **O5-13**

[7] Cal. Nat. Res. Agency, Final Statement of Reasons for Regulatory Action, Amendments to the State CEQA Guidelines, OAL Notice File No. Z-2018-0116-12 (Nov. 2018), at p. 95; see also *Lighthouse Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal. App. 4th 1170, 1207 (""[A]n inconsistency between a project and other land use controls does not in itself mandate a finding of significance. [Citations.]

> The Project would be constructed on a **93.5- acre parcel** at the northeast corner of Railroad Avenue and 13th Street, located within the central part of the City near existing residences and commercial uses. The Project would repurpose the **existing vacant site** and develop a **full-service film** and **television studio campus**. The Project Site was chosen due to its proximity to existing residences and public transit.
>
> Once operational, the Project would provide **services** to the local area by generating approximately **2,333 direct jobs** and **3,500 indirect jobs** for a total of approximately **6,000 jobs**. **These jobs would be available to existing and future City residents, in addition to residents in surrounding communities and cities.**

(DEIR, p. 4.7-15, emph. added.)

As such, the Project does not reduce any traffic – it in fact brings traffic to the City, including from other regions. The Project here is not a residential project or mixed use – it is an employment center, which will necessarily be growth-inducing, since it may result in people moving to the area to live in light of this employment opportunity.

O5-13
Continued

Here, however, the DEIR identifies but fails to demonstrate, beyond conclusory and misleading assertions, consistency with various legislative plans, such as the SCAG 2020-2045 RTP / SCS, the 2017 Scoping Plan Update, the City's Energy Plan, and general plan (DEIR p. 4.7-7-11) that include the above-listed requirements to be considered a qualified CAP or GHG Reduction Plan for the City. By way of example, it is unclear how such a large studio and facility with constant daily traffic is consistent with Goal CO 8 which intends energy efficiency and reducing energy and natural resource consumption and reduce emissions of greenhouse gases as well as reaching targeted reductions of GHG emissions consistent with AB 32, SB 375, and other implementing regulations when the Project is necessarily going to significantly increase GHG emissions from its current uses. Consistency with the other policies and the Santa Clarita Municipal Code section 24.01.010 are similarly lacking, especially considering the mentioned but unclear adherence to CEQA Guidelines 15064.4 that imposes requirements to consider several factors in determining significance. And those are a handful of examples.

O5-14

As such, the DEIR leaves an analytical gap showing that compliance with said plans can be used for a project-level significance determination for the Project.

Further, the DEIR fails to explain how compliance with the SCAG 2020-2045 RTP / SCS, the 2017 Scoping Plan Update, the City's Energy Plan, and the general plan leads to a less than significant impact, and specifically offsetting the increased GHG emissions due to increased traffic in connection with the construction of the studio and the use of them indefinitely thereafter, nor does it acknowledge updates to these programs since the drafting of the DEIR.

O5-14
Continued

2. *The DEIR Fails to Demonstrate How Compliance or Consistency with Applicable Greenhouse Gas Reduction Plans Will Lead to a Less than Significant Impacts on Greenhouse Gas Emissions.*

Second, the DEIR fails to explain or analyze how compliance with the GHG Reduction Plan (DEIR p. 4.7-6), even if it qualified for a consistency evaluation, will lead to a less than significant impact. The lead agency should explain how implementing the particular requirements in the plan, regulation or program ensure that the project's incremental contribution to the cumulative effect is not cumulatively considerable" (emphasis added).[8]

O5-15

3. *The DEIR Fails to Evaluate Cumulative Project GHG Impacts.*

A DEIR must discuss cumulative impacts when they are significant and the project's incremental contribution is "cumulatively considerable." CEQA Guidelines §15130(a). A project's incremental contribution is cumulatively considerable if the incremental effects of the project are significant "when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." CEQA Guidelines §15065(a)(3).

O5-16

Here, there is no evidence that the DEIR's Air Quality, Energy, Greenhouse Gas Emissions, and Health Risk Assessment Impact Analysis evaluated the Project's cumulative project GHG emissions, although it is mentioned in reference to other plans (DEIR p. 5.9-23).

Besides, given the above-described flawed and conclusory analysis of the Project's individual VMT and related GHG impacts and findings of less than significant impacts

[8] Natural Resources Agency (Nov. 2018) Final Statement of Reasons For Regulatory Action: Amendments To The State CEQA Guidelines ("2018 Final Statement of Reason"), p. 6, http://resources.ca.gov/ceqa/docs/2018_CEQA_Final_Statement_of%20Reasons_111218.pdf;

in the DEIR, the conclusion of no cumulative impact is derivatively inaccurate and unsupported.

The DEIR needs to conduct an accurate cumulative GHG impacts analysis, and if there is a potentially significant impact, impose adequate and all feasible measures.

O5-16
Continued

4. *The DEIR Fails to Analyze Cumulative Project Air Quality Impacts.*

The DEIR indicates that there would be several air quality impact domains but none that result in potentially significant impacts and suggests mitigation would be implemented to attend to the development-specific air quality mitigation measures through compliance with the SCAQMD (DEIR p. 4.2-19). This is inappropriate. "Formulation of mitigation measures should not be deferred until some future time." CEQA Guidelines § 15126.4(a)(1)(B); *see also San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 671 [EIR failed to provide and commit to specific criteria or standard of performance for mitigating impacts to biological habitats]; *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 281 [city improperly deferred mitigation to butterfly habitat by failing to provide standards or guidelines for its management]. Implementing mitigation, even if project specific, cannot be deferred until after Project approval.

O5-17

The DEIR only mentions some, but not all, of the nearby sensitive receptors, and fails to mention them in analysis concerning GHGs and only mentions them in Air Quality impacts as they relate to GHGs and air quality. In any case, the only ones mentioned are the single-family residences along Alderbrook Drive, the single-family residences south of Via Princessa, the single-family residences along Placeritos Boulevard, the mobile home park residences at 24833 Railroad, the Newhall Christian Church, the Village Church, Placerita Junior High School, Hart High School, Newhall Elementary School, and the Master's University (DEIR p. 4.11-4).

These are a critical omissions because these businesses, churches, and schools for young children will likely be significantly impacted by the Project's permanent operations and air quality impacts such as the increased traffic due to the Project's implementation air quality impacts, and other uses and activities corresponding with the significant increase in patrons, residents, and other congestion and use compared to its current use that lasts only part of the year, and thus drastically impacting the air quality analysis conducted in the DEIR, especially given the traffic and parking garage use that will persist throughout all hours of the day if the project is approved and

implemented, and notwithstanding the other construction activities that is proposed and likely to impact the currently existing sensitive receptors (DEIR p. 4.11-4), and sustained residential and commercial activities.

It further appears the proposed Project's development would occur in one phase spanning the two to three years (DEIR 4.11-5; 4.11-15) and therefore it is exceedingly likely that the sensitive receptors would be also impacted by significant construction and permanent air quality impacts at some point in the proposed Project's development cycles in the short term for another two to three years due to construction, and indefinitely beyond that for sustained uses.

The DEIR also indicates that it would not exceed its NOx, CO, and PM emissions with respect to applicable regional thresholds of significance set by the South Coast AQMD (DEIR 4.2-23), but inappropriately limits the distance impact to 70-feet to only include the closest sensitive receptors, without also including the other sensitive receptors and analyzing their distances, even though they are further. This is inappropriate. An agency may not avoid its responsibility to prepare proper environmental analysis by failing to gather relevant data. *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311. Furthermore, this may create significant and unavoidable impacts that would cumulative contribute to nonattainment designations in the SCAQMD, contrary to the DEIR's suggestions (DEIR 4.2-24). Because of this, or that the Project would introduce significant and unavoidable impacts even with mitigation, the City is required to determine either that (a) there is no feasible way to lessen or avoid the significant effect (CEQA Guidelines § 15091) and (b) to specifically identify expected benefits from the project that will outweigh the policy of reducing or avoiding significant environmental impacts of the project (CEQA Guidelines § 15093). However there is no clear indication the DEIR addresses these two requirements. Without attending to these CEQA requirements, the Project should be denied outright and if the Project wishes to move forward the DEIR should be redrafted and recirculated to incorporate these requirements.

O5-17 Continued

5. *The DEIR Fails to Adequately Disclose and Analyze the Project's Significant Noise Impacts.*

The DEIR conducts a thorough but frequently flawed noise analysis (DEIR p. 4.11-1-25). Generally speaking, the Project proposes significant changes in landscaping, which will necessarily involve corresponding significant increases to noise levels during

O5-18

construction and indefinitely after the Project is completed, especially considering the scope and scale of the Project as a massive television and movie studio.

As for sensitive receptors, the DEIR only mentions some, but not all, of the nearby sensitive receptors. The single-family residences along Alderbrook Drive, the single-family residences south of Via Princessa, the single-family residences along Placeritos Boulevard, the mobile home park residences at 24833 Railroad, the Newhall Christian Church, the Village Church, Placerita Junior High School, Hart High School, Newhall Elementary School, and the Master's University (DEIR p. 4.11-4). The DEIR also suggests that these sensitive receptors here would be shielded by intervening commercial and residential uses and are more than 900 feet from the Project site (DEIR p. 4.11-4).

But the DEIR fails to mention the Picasso's Playmates Creative Center, which caters to students of all ages, including very young children. The DEIR also fails to mention the nearby Santa Clarita Motel, Valencia Open Bible Church, the Iglesia El Buen Samaritano, the Affordable Veterinary Clinic, the Learning Post Academy adjacent to Hart High School, the Saint Sarkis Armenian Apostolic Church, the Allemande Music Academy, the Iglesia Del Calvario, the Elevate Church, Temple Beth Ami A Reform, Kingdom Hall of Jehovah's Witnesses, Our Lady of Perpetual Help Pastoral Center, Golden Oak Adult School, The Old Town Newhall Library, The Master's College and Master's University, Little Shepherds Nursery School, Hotel Lexen Santa Clarita Valencia Near Six Flags, Newhall Apartments, Ken-Lor Apartments, Whispering Oaks Senior Apartments, The Los Angeles County Fire Department Station 73, The Placerita Bible Church, and all other surrounding single-family residences and apartments, such as Golden Oaks Apartments, Villa Los Arboles Apartments, The Canyons at Santa Clarita Apartments, Walnut Park Cottages, and others.

O5-18 Continued

The primary noise sources were identified in the DEIR as vehicle traffic and railroad activity (DEIR p. 4.11-4), and significantly only measured noise in the early to mid-afternoon and not any other time throughout the day even though construction is anticipated to take place between the hours of 7:00 am to 7:00 pm Monday through Friday, and 8:00 am to 6:00 pm Saturday (DEIR 4.11-5; 4.11-15), so the sample size taken to account for noise levels accounts for only a fraction of the time and days (which aren't specified as to which days were sampled) and as such do not fully analyze the noise impacts that could be appropriately extrapolated to determine noise impacts. An agency may not avoid its responsibility to prepare proper environmental analysis by

O5-19

failing to gather relevant data. *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311.

The DEIR finds that the proposed Project would not result in a significant impact from traffic noise and indicates no feasible mitigation measures exist to reduce Project traffic noise impacts, even though it fails to analyze the other nearby sensitive receptors, including schools for small children and churches, hospice centers, a sea of surrounding single-family residences, and significant increases in noise levels beyond the current site uses, especially with the implementation of a nearly 93.5-acre site consisting of nearly 500,000 square feet of sound stages, over 200,000 square feet of production and administrative offices, and approximately 36,000 feet of catering and other specialty services for a nearly 1,300,000 square feet building area (DEIR pp. 4.11-14-25; ES-1).

Because of this, or that the Project would likely introduce significant and potentially unavoidable impacts even with mitigation, and as such the City is required to determine either that (a) there is no feasible way to lessen or avoid the significant effect (CEQA Guidelines § 15091) and (b) to specifically identify expected benefits from the project that will outweigh the policy of reducing or avoiding significant environmental impacts of the project (CEQA Guidelines § 15093). However there is no clear indication the DEIR addresses these two requirements, and certainly not the latter. Without attending to these CEQA requirements, the Project should be denied outright and if the Project wishes to move forward the DEIR should be redrafted and recirculated to incorporate these requirements.

O5-19
Continued

Given that the Project proposes significant changes in the landscape from an undeveloped plot that was never used for any purposes and will now be expanded to uses that will last all year and all times of the day, including improvements such as paved roads, constant traffic of construction vehicles and long-term transportation of large filmmaking equipment, parking, studios, catering, utility infrastructure, landscaping, signage, lighting, property walls, sidewalk improvements, and other immense structure and infrastructure implementation for the Project site, it is critical to conduct a thorough noise analysis, especially given the plethora of surrounding sensitive receptors.

The DEIR identified only a small fraction of the nearby sensitive receptors and the DEIR neglects or appears to neglect the other aforementioned sensitive receptors. This is a critical omission because these businesses, churches, and schools for young

children, and others will likely be significantly impacted by the Project's permanent operations and noise impacts associated with a large film and television studio and the significant increases in traffic and other ambient noise compared to its current undeveloped status that has no stationary or operational noise. The development of such a massive Project, especially juxtaposed to its current vacant site and undeveloped status drastically impacts the noise analysis conducted in the DEIR, which is amplified by the automobile and truck traffic that persists throughout all hours of the day if the Project is approved and implemented.

And, the nighttime construction and other construction activities that is proposed and likely to impact the currently existing sensitive receptors which includes on estimated demolition and grading, paving, building construction and painting over 29 months, which would utilize heavy-duty trucks, backhoes, bulldozers, excavators, front-end loaders, scrapers, and other equipment, during the hours of 7:00 am to 7:00 pm Monday through Saturday and only recognizes broader definitions of annoyance (human annoyance) which does not acknowledge to the specific impacts of this project to the nearest sensitive receptor (or other further sensitive receptors), over a nontrivial construction length (approximately 29 months). It appears the proposed Project's development would occur in phases spanning the next two to three years at a minimum (DEIR pp. 4.11-10-14) and therefore it is exceedingly likely that the sensitive receptors both acknowledged and unacknowledged, including the residences north of Victoria and south of the PCH would be also impacted by significant construction and permanent noise impacts at some point in the proposed Project's development cycle and beyond. O5-19 Continued

Lastly, the DEIR also leapfrogs impacts to these receptors by collapsing them to the closest residences to only those within close proximity to the Project (DEIR p. 4.11-5, 18-21), thereby artificially minimizing the noise impacts to these areas and other areas that are likely to be nonetheless impacted by the Project's construction and subsequent operation.

For all of these reasons, the DEIR's noise impact analysis, both individual and derivatively also cumulative, is fatally flawed, understated, and must be revised to comply with CEQA. For the same purpose, the missing information presents more severe impacts and therefore a significant information requiring the EIR recirculation.

6. *The DEIR Fails to Adequately Analyze Hazards and Hazardous Materials Impacts.* O5-20

The DEIR relies on the Environmental HELP Inc. Phase I Environmental Site Assessment report from 2020 to assess the hazard and hazardous materials impacts (DEIR p. 4.8-1).

The DEIR notes the proposed Project in or near existing in a very high fire hazard severity zone, including the Placerita Creek bed. This is critical especially given that it is surrounded by sensitive receptors surrounding the site on all sides.

However despite several considerations that are not addressed in the DEIR, it nonetheless concludes less than significant impacts for fire hazard (DEIR p. 4.8-9-15), no impact to emergency facilities, and does not recognize that the Project is located within 0.25 miles of an existing or planned school, or routine transport of hazardous materials.

Each of these conclusions is reached without full assessment of relevant and significant factors to fully evaluate their impacts to the proposed project site and surrounding areas, especially with the recognition of the Project site being within a very high severity fire hazard zone (DEIR p. 4.8-1), especially considering the burden it places on the nearby Fire Station 73 that was not recognized in the DEIR. The Project site was apparently used for fire department helicopter landings, and the Project site are very likely to remove this option for the fire department (DEIR p. 4.8-1).

O5-20
Continued

Next, the DEIR indicates that its compliance with federal, state, and local regulations are sufficient to ensure proper handling of hazardous materials to and from the project site. However this does not attend to the specific design of the project. A determination that regulatory compliance will be sufficient to prevent significant adverse impacts must be based on a project-specific analysis of potential impacts and the effect of regulatory compliance. In *Californians for Alternatives to Toxics v. Department of Food & Agric.* (2005) 136 Cal.App.4th 1, the court set aside an EIR for a statewide crop disease control plan because it did not include an evaluation of the risks to the environment and human health from the proposed program but simply presumed that no adverse impacts would occur from use of pesticides in accordance with the registration and labeling program of the California Department of Pesticide Regulation. See also *Ebbetts Pass Forest Watch v. Department of Forestry & Fire Protection* (2008) 43 Cal.App.4th 936, 956 (fact that Department of Pesticide Regulation had assessed environmental effects of certain herbicides in general did not excuse failure to assess effects of their use for specific timber harvesting project).

With no tailored analysis to the transportation and use of hazards and hazardous materials to a project that is expected to last another two to three years (at least), and with sustained and continued vehicle, commercial truck, and other uses beyond that typical for a film and television studio when the operational demands for the studio could be quite diverse, it is insufficient to only rely on overly-general regulatory requirements and guidelines.

O5-20
Continued

The DEIR must be revised to fully disclose and mitigate the Project's fire and other hazards (including by replacing PDFs with actual mitigation measures), and the EIR must be recirculated to include this new significant information and disclosures.

7. *The DEIR Fails to Adequately Analyze Significant Traffic and Transportation Impacts.*

As was discussed in the prior impact analyses, the DEIR neglects, or appears to neglect the other sensitive receptors including additional churches, parks, schools, fire department, single-family residences, and others. Specifically, the DEIR cites OPR's 2018 indicating a 15% reduction in VMT consistent with SB 743, focusing on thresholds of significance for three types of developments: residential, office, and retail. The DEIR believes that it matches the residential proxy category. Specifically, "A proposed residential project exceeding a level of 15 percent below average existing regional (i.e., City of Santa Clarita) VMT per capita may indicate a significant transportation impact." (DEIR 4.14-10). This is assessed using the outdated 2016 SCAG RTP / SCS Regional Travel Demand Model used to generate statistics, and as such is inappropriate when a more updated model is available (DEIR 4.14-10).

O5-21

Yet, the Project is not necessarily residential but an employment project, and therefore higher thresholds must apply.

To achieve the legislative goals of reducing traffic impacts under SB 743, the Office of Planning and Research ("**OPR**") issued its 2018 Technical Advisory on Evaluating Transportation Impacts in CEQA,[9] which recognizes that areas outside of metropolitan planning areas, especially rural counties, have fewer options for reducing VMT. (OPR Advisory, 15-16.) As such, VMT thresholds may be best determined on a case-by-case basis. (*Ibid.*)

As for non-rural areas, the land use project VMT thresholds recommended by OPR for projects in metropolitan planning organization (MPO) areas are listed below:

[9] See, https://opr.ca.gov/docs/20180416-743_Technical_Advisory_4.16.18.pdf

- For residential projects, OPR recommends a project threshold of 15 percent below the existing VMT per capita, either measured as a regional VMT per capita or as city VMT per capita. The VMT for the residential metric only includes VMT generated by residents, some of which starts and ends outside the area.

- For office projects, OPR recommends a project threshold of 15 percent below the existing regional VMT per employee. The VMT for the office metric only includes VMT generated by workers employed in the area.

- For retail projects, OPR recommends a project threshold of any net increase in total area VMT. Another VMT per capita threshold option is total VMT per service population (total of residents and employees). (*Ibid.* at 12-14.)

O5-21
Continued

It does not appear the Project meets the applicable thresholds of significance and there is substantial evidence that it actually exceeds those applicable thresholds.

The DEIR also used the CEQA Guidelines Appendix G checklist (a-d) for its assessment, and found that there was no mitigation required for less than significant impacts to (a) and (b) where (a) conflicts with a program plan, etc. and (b) conflicts with CEQA section 15064.3(b), and less than significant impacts with mitigation incorporated to (c) and (d), where (c) increasing hazards due to a geometric design feature, or (d) impact emergency access.

O5-22

The DEIR offers vague assertions regarding compliance with existing policies for bicycle and pedestrian facilities, and does not provide any direct transit service. Also noteworthy is the presence of the adjacent Fire Station 73, and how it would very likely be impacted due to any road closures on Railroad Avenue and other adjacent roadways due to construction or sustained traffic use because of the studio. Yet the only mitigation proposed fails to acknowledge the fire station and it is unclear how the emergency access mentioned would be tailored to the needs of Fire Station 73, and instead makes references to access points that have yet to be constructed, which do not account for access needs prior to such improvements being made (DEIR 4.14-20). This is a critical omission because it impacts a fire station's ability to respond to emergencies, and especially when the construction is expected to last six days a week and nearly the entire day from the hours of 7:00 am to 7:00 pm.

O5-23

Furthermore, because the surrounding sensitive receptors are significantly closer to the proposed Project's permanent operations and transportation use, the impacts to these sensitive receptors will be drastically impacted compared to what is currently suggested and projected in the DEIR, especially given the studio activity that will persist throughout all hours of the day if the project is approved and implemented. This is independent of any nighttime concrete pouring or other construction activities are likely to impact the currently existing sensitive receptors, and sustained film production activities would nonetheless result in significant and unavoidable impacts. O5-24

In light of the DEIR's unsupported assertions that the Project would require no mitigation because the impacts were found to be less than significant, its analysis is incomplete for the DEIR's failure to consider the various factors mentioned above (DEIR p. 4.14-12-21). In reality impacts are likely to be significant even with mitigation incorporated. As such, the City is required to determine either that (a) there is no feasible way to lessen or avoid the significant effect (CEQA Guidelines § 15091) and (b) to specifically identify expected benefits from the project that will outweigh the policy of reducing or avoiding significant environmental impacts of the project (CEQA Guidelines § 15093). O5-25

Instead there is no indication the DEIR addresses these two requirements, and certainly not the latter since it found less than significant impacts across all evaluated potential impacts. Without attending to these CEQA requirements, the Project should be denied outright, and if the Project wishes to move forward the DEIR should be redrafted and recirculated to incorporate these requirements. An agency may not avoid its responsibility to prepare proper environmental analysis by failing to gather relevant data. *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311.

8. *The DEIR Fails to Adequately Analyze Any Biological Impacts.*

When considering or imposing mitigation, lead agencies must ensure there is a "nexus" and "rough proportionality" between the measure and the significant impacts of the project. CEQA Guidelines, § 15126.4, subd. (a)(4)(A); see *Nollan v. Cal. Coastal Commission* (1987) 483 U.S. 825; *Dolan v. City of Tigard* (1994) 512 U.S. 374. All mitigation must be feasible and fully enforceable, and all feasible mitigation must be imposed by lead agencies. CEQA Guidelines, § 15041. Formulation of mitigation measures shall not be deferred until some future time. CEQA Guidelines, § 15126.4, subd. (a)(B). O5-26

It is important to note the DEIR analyzes and found the high likelihood and actual presence of many special-status species, such as 42 special-status plant species, the California horned lark, San Diego black tailed jackrabbit, California legless lizard, coastal whiptail, coast horned lizard, bell's sage sparrow, loggerhead shrike, burrowing owl, coastal California gnatcatcher, Southern California rufous-crowned sparrow, Cooper's hawk, yellow warbler, raptor nesting birds, sensitive plant communities, and a nearby coastal California gnatcatcher approximately two miles to the south (DEIR 4.3-3-6).

Given the Project site's enormous size, there is a strong likelihood that even more special status-plant or species exist on the Project site. The DEIR relies on several plant and animal surveys to gather evidence of biological impacts; significantly, one of those dates back as far back as 2015. It is therefore also incredibly likely circumstances have changed as to the presence of special status plant and animal species in eight years. An agency may not avoid its responsibility to prepare proper environmental analysis by failing to gather relevant data. *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311. The City must reevaluate the possibility of special-status plant species in the area in light of these considerations. And this is independent of the efficacy of any oak tree removal and compliance with the City of Santa Clarita's ordinance to ensure effective relocation, removal, and additions.

O5-26
Continued

It is also unlikely that given the sheer number of special status plants and animals on or likely to be on the Project site during construction and beyond that the DEIR's conclusions of no significant impacts are accurate (DEIR 4.3-17-25). When mitigation is required or mentioned in the DEIR, much of it is proposed for some later time, which is disallowed under CEQA as deferred mitigation. "Formulation of mitigation measures should not be deferred until some future time." CEQA Guidelines § 15126.4(a)(1)(B); *see also San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 671 [EIR failed to provide and commit to specific criteria or standard of performance for mitigating impacts to biological habitats]; *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 281 [city improperly deferred mitigation to butterfly habitat by failing to provide standards or guidelines for its management]. Implementing mitigation, even if project specific, cannot be deferred until after Project approval.

9. *The DEIR Fails to Supports its Land Use Analysis with Substantial Evidence.*

O5-27

The DEIR claims consistency of its Land Use Analysis with the City's General Plan (DEIR p. 4.10-1-42). This is in error. Specifically, there are many instances of conflicts between the applicable general plan policies and the Project's Consistency Analysis.

For instance, Policy LU 1.1.3 discourages urban sprawl, but it is unclear how the DEIR concludes the Project site is in-fill since it is currently undeveloped (DEIR 4.10-18). It also fails to maintain natural features since it proposes to develop or at least develop portions of the naturally occurring Palcerita Creek (DEIR 4.10-18). As for Policy LU 1.2.6, it is unclear how a proposed film studio would ensure compatibility with existing rural, equestrian, and National Forest land (DEIR 4.10-19). It is unclear how the Project requiring grading of a portion of a Placerita Creek ridgeline is consistent with Policy LU 1.3.2 which seeks to substantially retain the integrity and *natural* grade elevations of significant natural ridgelines. The Project achieves the opposite. (DEIR 4.10-19). **O5-27 Continued**

The Project also fails consistency with Policy LU 2.2.1 to identify and minimize any diminished use of their aesthetic quality. It is a leap in logic to conclude that since the development of the studio would not occlude the entire view of the hillside, that it is therefore has a sufficiently diminished impact to its aesthetic quality. (DEIR 4.10-20). Policy LU 4.5.3 proposes the use of state-of-the-art technology in furtherance of energy conservation, but the proposed consistency analysis provides for the minimum requirements by mentioning the CALGreen Code (DEIR 4.10.22). The DEIR also mentions consistency with Policy LU 5.2.3, LU 6.4.1 by referring to other Policy considerations (e.g., Policy LU 4.2.1) but does not explain how they are consistent. An agency may not avoid its responsibility to prepare proper environmental analysis by failing to gather relevant data. *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311. A full analysis is needed. **O5-28**

Policy LU 7.2.3 requires a sustainable water supply prior to approval, while the proposed consistency indicates an "adequate" determination. It is unclear if "sustainable" and "adequate" are synonymous here (DEIR 4.10-25). **O5-29**

Policy LU 7.3.5 demands limited development within flood-prone areas, which the DEIR recognizes as what the Project will do. Despite this, the DEIR nonetheless concludes consistency with this policy even though California has experienced significantly more rain and therefore is even more likely to create the very issues Policy LU 7.3.5 seeks to avoid (DEIR 4.10.25). Policy LU 7.4.1 requires the use of drought tolerant landscaping, and the proposed consistency indicates that a majority of the **O5-30**

proposed trees would be drought tolerant, without indicating whether the remaining trees would offset the drought tolerant trees (DEIR 4.10-26), so the implementation could still result in higher levels of water use. Policy C 3.1.1 requires trip reduction measures to relieve congestion and reduce air pollution, but the Project will necessarily *increase* congestion and air pollution.

O5-30
Continued

These are but a few of the examples of the Project's incongruous analysis of consistency with existing land use policies. As such, the DEIR should be revised to attend more closely to consistency between these policies.

O5-31

10. *The DEIR Fails to Support its Findings on Energy Impacts with Substantial Evidence.*

Pursuant to CEQA Guidelines, section 15126.2, subsection (b), analysis of a project's energy impacts "should include the project's energy use for all project phases (DEIR p. 4.13-29) and components, including transportation-related energy, during construction, and operation." Further, the Guidelines provide that "other relevant considerations may include . . . the project's size, location, orientation, equipment use, and any renewable energy features that could be incorporated into the project." Ibid.

Failing to undertake "an investigation into renewable energy options that might be available or appropriate for a project" violates CEQA. *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 213. Energy conservation under CEQA is defined as the "wise and efficient use of energy." CEQA Guidelines, appen. F, § I. The "wise and efficient use of energy" is achieved by "(1) decreasing overall per capita energy consumption, (2) decreasing reliance on fossil fuels such as coal, natural gas and oil, and (3) increasing reliance on renewable energy resources." *Ibid.*

O5-32

According to Appendix F of the CEQA Guidelines, an environmental document must consider and analyze:

1. The project's energy requirements and its energy use efficiencies;

2. The project's effects on local and regional energy supplies and on requirements for additional capacity;

3. The project's effects on peak-period and base-period energy demands;

4. The degree to which the project complies with existing energy standards;

5. The project's effects on energy resources; and,

6. The project's projected transportation energy use and its overall use of efficient transportation alternatives.

CEQA Guidelines, appen. F.

Basing a Project's energy impacts on its compliance with the California Building Energy Efficiency Standards does not constitute an adequate analysis of energy. *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 Cal.App.4th 256, 264-65; see Cal. Code Regs., tit. 24, part 6. Similarly, the court in *City of Woodland* held unlawful an energy analysis that relied on compliance with Title 24, that failed to assess transportation energy impacts, and that failed to address renewable energy impacts. *City of Woodland*, *supra*, 225 Cal.App.4th at pp. 209-13.

First, the DEIR briefly mentions certain practices and equipment which the Project will engage to reduce energy consumption, though the details are vague and uncertain. For example, the DEIR suggests that construction contractors will comply with various federal and statute regulations and recommendations but provides no specifics as to how that would be achieved (DEIR p. 4.5-10).

O5-32
Continued

Second, in addressing long-term energy impacts during operation, the DEIR admits that the project would not directly require excessive long-term operational fuel consumption (DEIR p 4.5-10). It fails, though, to consider renewable energy uses and feasible conservation efforts beyond references that may or may not be implemented or adhering to state-mandated production requirements.

Third, the DEIR concludes that, with respect to operation-related fuel usage, energy impacts would be less than significant. It bases this conclusion on a cursory and conclusory analysis of VMT and the contention that "the amount of energy and fuel consumed by construction and operation of the Project would not be inefficient, wasteful, or unnecessary." (DIER p. p. 4.5-10). Yet, that the Project would not cause or result in the need for additional measures does not conclusively establish that the Project will not result in significant energy impacts or waste and inefficiency. This line of analysis is neither reasonable nor focused on energy use caused by the Project.

Without assessing the Project's use of energy activities in accordance with the CEQA Guidelines, the DEIR concludes that the Project will not result in wasteful, inefficient, or unnecessary energy use. Consequently, it must be recirculated after broadening its scope and incorporating details, in particular, expanded options for renewable energy solutions.

11. *The DEIR's Project Description Is Inadequate.*

The DEIR must be recirculated because it also lacks an adequate Project description. "[A]n accurate, stable and finite project description is the sine qua non of an informative and legally sufficient" environmental document. *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 200. "A curtailed or distorted project description may stultify the objectives of the reporting process" as an accurate, stable, and finite project description is necessary to allow "affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance. *Ibid.* at pp. 192-93.

O5-33

CEQA Guidelines, section 15124 requires a project describe in enough detail to allow for evaluation of its potential environmental impacts: (a) the project's precise location and boundaries; (b) a clearly written statement of objectives sought by the proposed project; (c) a description of the project's technical, economic, and environmental characteristics; and (d) a statement describing a list of agencies, permits, and approval which the project expects to use.

The DEIR's Project description does not satisfy this project description requirement by failing to clearly include a statement of objectives. (DEIR 2.0-4-5). Rather, the Project description merely provides some, but not all of the requirements of CEQA Guidelines *Ibid.* Also, as noted above, the Project improperly includes some mitigation measures as project design features thereby avoiding the study of their impacts.

O5-34

Furthermore, the DEIR provides no description of the Project's economic characteristics or clearly written statement and objectives. For these reasons too, the DEIR must be revised and recirculated.

12. *The Project and its CEQA Analysis Violate CEQA for Improper Piecemealing and Incorrect (Inflated) Baseline.*

Project has incrementally expanded over time and will likely continue to expand given its proposed phases, approximately two to three years, throughout the DEIR. Such expansion is suspect and in violation of CEQA's piecemealing prohibition. (*Lighthouse Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal.App.4th 1170, 1208–1209 ["The requirements of CEQA cannot be avoided by piecemeal review which results from 'chopping a large project into many little ones-each with a minimal potential impact on the environment-which cumulatively may have disastrous consequences.' (*Bozung v.*

O5-35

Local Agency Formation Com. (1975) 13 Cal.3d 263, 283–284.")].) The danger of piecemealing is many-fold. First, it precludes consideration of impacts of the "whole of an action" under CEQA Guidelines § 15387, as has happened here. As explained by courts:

> "[O]nly through an accurate view of the project may the public and interested parties and public agencies balance the proposed project's benefits against its environmental cost, consider appropriate mitigation measures, assess the advantages of terminating the proposal and properly weigh other alternatives...." (*City of Santee v. County of San Diego, supra,* 214 Cal.App.3d at p. 1454, 263 Cal.Rptr. 340.) Here, the failure to consider the expansion of the wastewater treatment plant as part of the project under consideration resulted in an inaccurate project description and incomplete identification and analysis of the environmental effects of the development project (*Santiago County Water Dist. v. County of Orange, supra,* 118 Cal.App.3d at p. 829, 173 Cal.Rptr. 602.) As stated in **717 *Citizens Assn. for Sensible Development of Bishop Area v. County of Inyo* (1985) 172 Cal.App.3d 151, 166, 217 Cal.Rptr. 893, "[t]he danger of filing separate environmental documents for the same project is that consideration of the cumulative impact on the environment of the two halves of the project may not occur. This danger was here realized."
>
> Thus, because the FEIR did not "adequately apprise all interested parties of the true scope of the project for intelligent weighing of the environmental consequences of the project," informed decision making was precluded. The FEIR is inadequate as a matter of law. (*City of Santee v. County of San Diego, supra,* 214 Cal.App.3d at pp. 1454–1455, 263 Cal.Rptr. 340.) The certification by the Board of the FEIR as complete and adequate constituted an abuse of discretion. (*County of Inyo v. City of Los Angeles, supra,* 71 Cal.App.3d at p. 200, 139 Cal.Rptr. 396.)

(*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 734–735.)

O5-35
Continued

Second, piecemealing *alters* the accurate baseline of the CEQA analysis. Thus, under CEQA, the baseline environmental conditions (to measure the Project's impacts against) must be set as early as possible when the Project's environmental review

O5-36

begins. (CEQA Guidelines § 15125(a)(1).) Here, the environmental review of the project began at least in 2019, and likely earlier, given the surveys conducted.

Therefore, the Project's baseline or existing environmental conditions for purposes of CEQA review must go back to the year of 2022 and measure the Project's proposed changes – regardless of when they were proposed (in 2022 or later) – against that lower 2022 baseline. However, as evident from the DEIR, the applicant is not measuring the Project's impacts "as a whole" or as of 2019 and its iterations through 2026 and beyond, but rather focuses on the impacts of the proposed *changes* after the 2022 and 2023 approvals. As such, the Applicant is seeking to alter/inflate the baseline and thereby understate the Project's impacts.

Further, for CEQA purposes, the fact that a project is entitled or is warranted under the general plan is not relevant for the baseline. (CEQA Guidelines § 15125(a)(3) ["An existing conditions baseline shall not include hypothetical conditions such as those that might be allowed, but have never actually occurred under existing permits or plans as the baseline."])

O5-36
Continued

Stated otherwise, the Applicant is trying to use various 2019 baselines and surveys instead more updated or recent baselines post-covid, and thereby *inflates* the baseline through its 2019 approvals and other changes in the surrounding area, in order to minimize and understate the changes it proposes. This is the classic case of trying to *end run* CEQA, where courts agree a *different* baseline must be used. "Of course, were there evidence of an attempted end run around CEQA, use of a different baseline may well be appropriate." (*Hollywoodians Encouraging Rental Opportunities v. City of Los Angeles* (2019) 37 Cal.App.5th 768, 781, fn. 11.) (*See also*, *POET, LLC v. State Air Resources Bd* (2017) 12 Cal.App.5th 52, 83 [use of an inflated baseline had the effect of understating the increase of impacts, requiring reversal]; *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 953 (*"County of Amador"*) [without an accurate baseline, the "analysis of impacts, mitigation measures and project alternatives becomes impossible."])

Furthermore, an accurate, stable, and finite project description must be the *bona fide* subject of an EIR, an accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR; the defined project and not some different project must be the EIR's bona fide subject. (*Mira Monte Homeowners Assn. v. County of Ventura* (1985) 165 Cal.App.3d 357, 365 [212 Cal.Rptr. 127].) "CEQA compels an interactive process of assessment of environmental impacts and responsive project

O5-37

modification which must be genuine. It must be open to the public, premised upon a full and meaningful disclosure of the scope, purposes, and effect of a consistently described project, with flexibility to respond to unforeseen insights that emerge from the process." (Id., at p. 366, internal quotation marks omitted.) (*Burbank-Glendale-Pasadena Airport Authority v. Hensler* (1991) 233 Cal.App.3d 577, 592, emph. added.)

O5-37
Continued

The Project appears to have manifestly piecemealed the Project by initially proposing a smaller scale project for approval now and will likely incrementally increasing the scale and intensity of the Project. The Project represents a classic case of piecemealing where the same applicant fails to accurately disclose the full scope of the project during the initial environmental review and incrementally increases the project after the initial environmental document is approved, in order to avoid analyzing the impacts of the "whole of the action" as CEQA requires. That is what CEQA prohibits and to which the case law is clear. (*Arviv Enterprises, Inc. v. South Valley Area Planning Com.* (2002) 101 Cal.App.4th 1333, 1348–1351 [requiring an EIR for the whole of an action, including *permitted* and even *built out* single family homes and rejecting the applicant's argument about *vested rights,* "Compliance with these existing laws was thus required notwithstanding the City's failures and/or Arviv's misleading project descriptions which may have prevented the City from appreciating the full scope of the proposed development." *Id.* at 1350.])

O5-38

III. THE PROJECT VIOLATES THE STATE PLANNING AND ZONING LAW AS WELL AS THE CITY'S GENERAL PLAN

A. Background Regarding the State Planning and Zoning Law

A DEIR must identify, fully analyze and mitigate any inconsistencies between a proposed project and the general, specific, regional, and other plans that apply to the project. CEQA Guidelines § 15125(d); *Pfeiffer v. City of Sunnyvale City Council* (2011) 200 Cal.App.4th 1552, 1566; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 881. There does not need to be a direct conflict to trigger this requirement; even if a project is "incompatible" with the "goals and policies" of a land use plan, the IS/MND must assess the divergence between the project and the plan, and mitigate any adverse effects of the inconsistencies. *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 378-79; *see also Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903 (holding under CEQA that a significant impact exists where project conflicts with local land use policies);

O5-39

Friends of "B" Street v. City of Hayward (1980) 106 Cal.App.3d 988, 998 (held county development and infrastructure improvements must be consistent with adopted general plans) (citing Gov. Code 65302). O5-39 Continued

B. The Proposed Land Use Amendments and Entitlements Conflict with SB 375 and SCAG's 2020 Regional Transportation Plan and Sustainable Communities Strategy

In 2008, Senate Bill 375 amended CEQA and empowered metropolitan planning organizations (MPOs) to enact regional plans to reduce GHG emissions from passenger vehicles. MPOs are required to prepare regional transportation plans (RTP) and sustainable community strategies (SCS) in an effort to meet CARB's GHG reduction goals under SB 375. Gov. Code § 65080(b)(2)(B). SB 375 specifically targets GHG emissions from passenger vehicles by linking land use decisions to transportation planning. *Id.* If the regional SCS/RTP plan does not achieve CARB's GHG reduction targets, then the MPO is required to create an alternative planning strategy (APS) that shows how the targets can be achieved through other mechanism such as alternative development patterns, infrastructure decisions, or other alternative transportation measures or policies that can still achieve CARB's reduction targets. Gov. Code § 65080(b)(2)(I). O5-40

For this Project, the applicable plan is SCAG's 2020-2045 RTP/SCS plan adopted on September 3, 2020.

The DEIR fails to analyze the Project's consistency with SCAG's 2020-2045 RTP/SCS plan given the many unverified and unanalyzed transportation impacts and the strong likelihood of increases to VMT rather than decreases due to the Project's development on land that consists mostly of parking spaces which will be replaced with substantial residential, commercial, and hotel uses, as well as no indication of transit discounts or improvements to accessibility to the Amtrak commuters during construction or how it impacts their commute or use after the Project's completion, or how the Project's significant patronage, resident, and hotel occupant increases would affect demand on the surrounding area and transportation networks. For example, SCAG's 2020 RTP/SCS requires or suggests the following that the Project fails to consider or adopt in the DEIR: O5-41

- Land Use Policies: pursuing affordable housing or providing more transportation options for short trips;[10]
- Transportation Network Strategies: providing transit fare discounts; providing transit integration strategies such as integration of active transportation and transit by improving pedestrian access and bicyclist access;[11]
- Transportation Demand Management Strategies: encourage use and implementation of TDM strategies such as rideshare incentives, parking management, parking subsidies for carpoolers, incentives for telecommuting, integrated mobility hubs, or additional investments in active transportation infrastructure;[12] and
- Clean Vehicle Technology Strategies: use of neighborhood electric vehicles (NEVs), and anticipating shared mobility platforms, car-to-car communication or automated vehicle technologies.[13]

O5-41
Continued

The DEIR fails to demonstrate consistency with the most recent SCAG 2020-2045 RTP / SCS Plan and should be revised to meet its goals and policies.

IV. CONCLUSION

Based on the foregoing, we respectfully request the City deny the Project, its DEIR, and order the applicant to revise the Project to ensure its consistency with all applicable laws and regulations as detailed above, as well as to study the "whole of the action" and use the accurate *bona fide* project description and baseline for purposes of CEQA review. "CEAQ contemplates *serious* and not superficial or pro forma consideration of the potential environmental consequences of a project. *Leonoff v. Monterey County Bd. Of Supervisors* (1990) 222 Cal.App.3d 1337, 1347, 272 Cal.Rptr. 372; emphasis added; *Burbank-Glendale-Pasadena Airport Authority v. Hensler* (1991) 233 Cal.App.3d 577, 593, fn. 3.

O5-42

If the City has any questions or concerns, please do not hesitate to contact our office.

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

O5-43

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

O5-43
Continued

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[5] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.
[6] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added). [12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin

Air Basin	Rural (miles)	Urban (miles)
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8

[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

O5-43
Continued

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al.,, et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal repesentatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Hagemann, M.F., 2001. Estimated Cleanup Cost for MTBE in Groundwater Used as Drinking Water. Unpublished report.

Hagemann, M.F., 2001. Estimated Costs to Address MTBE Releases from Leaking Underground Storage Tanks. Unpublished report.

Hagemann, M.F., and VanMouwerik, M., 1999. Potential Water Quality Concerns Related to Snowmobile Usage. Water Resources Division, National Park Service, Technical Report.

VanMouwerik, M. and **Hagemann, M.F**. 1999, Water Quality Concerns Related to Personal Watercraft Usage. Water Resources Division, National Park Service, Technical Report.

Hagemann, M.F., 1999, Is Dilution the Solution to Pollution in National Parks? The George Wright Society Biannual Meeting, Asheville, North Carolina.

Hagemann, M.F., 1997, The Potential for MTBE to Contaminate Groundwater. U.S. EPA Superfund Groundwater Technical Forum Annual Meeting, Las Vegas, Nevada.

Hagemann, M.F., and Gill, M., 1996, Impediments to Intrinsic Remediation, Moffett Field Naval Air Station, Conference on Intrinsic Remediation of Chlorinated Hydrocarbons, Salt Lake City.

Hagemann, M.F., Fukunaga, G.L., 1996, The Vulnerability of Groundwater to Anthropogenic Contaminants on the Island of Maui, Hawaii. Hawaii Water Works Association Annual Meeting, Maui, October 1996.

Hagemann, M. F., Fukanaga, G. L., 1996, Ranking Groundwater Vulnerability in Central Oahu, Hawaii. Proceedings, Geographic Information Systems in Environmental Resources Management, Air and Waste Management Association Publication VIP-61.

Hagemann, M.F., 1994. Groundwater Characterization and Cleanup at Closing Military Bases in California. Proceedings, California Groundwater Resources Association Meeting.

Hagemann, M.F., 1993. U.S. EPA Policy on the Technical Impracticability of the Cleanup of DNAPL-contaminated Groundwater. California Groundwater Resources Association Meeting.

Hagemann, M.F., 1992. Dense Nonaqueous Phase Liquid Contamination of Groundwater: An Ounce of Prevention... Proceedings, Association of Engineering Geologists Annual Meeting, v. 35.

Other Experience:

Selected as subject matter expert for the California Professional Geologist licensing examination, 2009-2011.

Letter No. O5
Jason A. Cohen
Southwest Mountain States Regional Council of Carpenters
c/o Mitchell M. Tsai
139 South Hudson Avenue, Suite 200
Pasadena, CA 91101

Response to Comment No. O5-1

Please refer to Response to Comment Nos. O1-1 through O1-4 above.

Response to Comment No. O5-2

The comment describes the purpose of CEQA and the CEQA Guidelines. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-3

The comment cites several CEQA case law examples and Public Resources Code (PRC) and CEQA Guidelines sections regarding the preparation of an EIR and states that the City should prepare an EIR for the Project. The CEQA document that was circulated for public review between April 6, 2023, and May 22, 2023, is a Draft EIR that was prepared for the Project. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-4

The comment cites several PRC and CEQA Guidelines sections and a case law regarding recirculation of an EIR when substantial changes to the Draft EIR or new information about the Project occurs. However, the comment presents no information or substantial evidence about any specific impact area that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-5

The comment states that the Draft EIR improperly labeled mitigation measures as project design features. Project design features (PDFs) are features of the Project that would be included in the construction and operation of the Project that would be implemented above and beyond compliance with specific regulations and requirements. The description and inclusion of PDFs in the Draft EIR is not improper, as alleged by the commenter, but rather aids in fulfilling the required contents of an EIR. CEQA Guidelines Section 15126.4, in particular, expresses that an EIR should discuss “the measures which are proposed by project proponents to be included in the project.”

The PDFs used in the air quality analysis are features that would be incorporated into the construction of the Project and are not required by current regulations. PDFs typically provide a benefit or a reduction to impacts. For example, the example of photovoltaic systems and solar panels not required by City code would result in a reduction in electrical consumption from the grid, as well as a reduction in greenhouse gas (GHG) emissions. Therefore, the inclusion of the PDFs identified in Section 4.2, Air Quality, of the Draft EIR, is not considered mitigation because

it is part of the construction design of the Project, and there are no current regulations requiring specific construction equipment to be used. No changes to the Draft EIR are made based on this comment.

Response to Comment No. O5-6

The comment reiterates the statement that the Draft EIR improperly labeled mitigation measures as PDFs with specific examples from Section 4.2, Air Quality, of the Draft EIR, and asserts that the PDFs provide an unwarranted reduction in Project emissions. However, the application of all Tier 3 equipment in the CalEEMod emissions analysis does not result in meaningfully different emissions than the default construction equipment fleet in the model, as shown in **Table O5-1-1**:

TABLE O5-1
CONSTRUCTION CRITERIA POLLUTANT EMISSIONS USING TIER 3 EQUIPMENT

Emissions Source	Maximum Emissions (pounds/day)[a]					
	VOC	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Maximum Tier 3 Fleet Emissions	43	53	104	<1	26	7
Maximum CalEEMod Default Fleet Emissions	44	49	99	<1	27	11
South Coast AQMD Regional Thresholds	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	***No***	***No***	***No***	***No***	***No***	***No***

Notes:
VOC = volatile organic compounds; NO_x = nitrogen oxide; CO = carbon monoxide; SO_2 = sulfur dioxide;
PM_{10} = particulate matter 10 micrometers in diameter or less; $PM_{2.5}$ = fine particulate matter 2.5 micrometers or less in diameter
[a] Emissions were calculated using CalEEMod version 2020.4.0, as recommended by the South Coast AQMD.
Source: Rincon Consultants, Inc., June 2023.

Similar emissions between the Tier 3 equipment fleet and the default equipment fleet result from the default fleet including some Tier 4 equipment. Given that the PDFs provide that Tier 3 equipment be used at a minimum, it is likely that some Tier 4 equipment would also be used on-site (similar to the default fleet mix), resulting in less emissions than presented in the Draft EIR. Regardless, without or with the PDFs that require a minimum of Tier 3 equipment, Project emissions would be below the South Coast AQMD thresholds of significance and, therefore, less than significant.

Response to Comment No. O5-7

The comment asserts that the air quality impact analysis is flawed because it only looked at the residential uses nearby and did not take into account other potential sensitive receptors. While there may be other sensitive receptors in the area, the air quality analysis focused on residential sensitive receptors that are located within 1,000 feet of the Project Site. Religious institutions would be considered residential receptors assuming that a religious leader lives on the premises. School site receptors are impacted less than residential receptors as students/staff are present on-site for a fraction of the day and, thus, have less exposure than residences at which the analysis assumes the resident is present for the whole day (i.e., a 24-hour per day exposure). Additionally, the analysis focused on the receptors located immediately adjacent to the Project Site as the dispersion of pollutants generated by the Project was assumed to have the greatest impact on these receptors. Therefore, if the impacts on the receptors are less than significant, then those receptors that are farther away would experience less impacts, which would also be less than significant.

This 1,000-foot radius is typical of air quality analysis of sensitive receptors and is based on the recommendations of the California Air Resources Board in their Air Quality and Land Use Handbook A Community Health Perspective.[11] The Handbook identifies that the pollutant exposures can be reduced by as much as 80 percent using the buffer distances. Therefore, while there may be other sensitive receptors that are nearby, the distance between the Project Site and the receptors indicates that impacts to these receptors would be substantially less than the impacts identified in the analysis for the receptors identified within 1,000 feet of the Project Site. Therefore, the air quality analysis in the Draft EIR adequately addressed impacts to sensitive receptors.

Response to Comment No. O5-8

The comment asserts that Project Design Feature PDF-PUB-1, specifically as related to the roadway extension, should have been identified as a mitigation measure instead of a PDF as it may have impacts on the environment. The roadway referred to in the PDF is internal to the Project Site and, as such, part of the Project's site plan and internal circulation. Impacts associated with all internal roadways have already been accounted for in the analyses of the Project's construction impacts. In addition, the PDF reiterates the fire code requirements. Accordingly, implementation of the PDF would not have impacts of its own.

Response to Comment No. O5-9

The comment asserts that the analyses in the Draft EIR used PDFs and upgrades to adjacent streets and intersections to reduce impacts and avoid scrutiny of whether those proposed Project improvements would be efficient or whether they will have impacts of their own in need of mitigation.

As identified on page 4.14-18 in Section 4.14, Transportation, of the Draft EIR, to provide for a conservative analysis, Project Design Feature PDF-TA-1 was not included in the VMT analysis, which still showed that the Project would result in a less-than-significant VMT impact. Additionally, all of the physical improvements noted in Project Design Feature PDF-TA-1 (e.g., bicycle facilities and intersection improvements) are part of the Project, and the potential impacts of such improvements were evaluated as part of the Project's impacts in the Draft EIR.

Similarly, as identified on page 4.17-12 in Section 4.17, Wildfire, of the Draft EIR, the fire modeling conducted for post-development conditions showed that fire potential on the Project Site would be lower than existing conditions due to fire safety requirements that would be implemented by the Project, including those in the 2022 California Fire Code, which have been adopted by reference in the Los Angeles Fire Code; Santa Clarita Municipal Code (SCMC); 2022 California Building Code; and Public Resources Code. Project Design Features PDF-WF-1 through PDF-WF-4 are some of the specific procedures proposed to be implemented by the Project above and beyond regulatory compliance to ensure safety of workers during Project construction and Project occupants/employees during operation.

Response to Comment No. O5-10

The comment asserts that the City violated CEQA by labeling mitigation measures as project design features. CEQA only requires mitigation measures if substantial evidence exists of

[11] California Air Resources Board, Air Quality and Land Use Handbook: A Community Health Perspective, April 2005.

potentially significant environmental impacts. In particular, CEQA Guidelines Section 15126.4(a)(4)(A) states that there must be an essential nexus between the mitigation and a legitimate government interest (i.e., potential significant impact). As discussed in Response to Comment No. O5-9 above, without the PDFs or mitigation measures, the Project would result in less-than-significant impacts related to air quality, public services, VMT, and wildfire. Accordingly, the construction techniques, TDM features, and fire safety procedures proposed by the Project are appropriately shown as PDFs and not mitigation measures.

Response to Comment No. O5-11

The comment asserts that the Draft EIR failed to support its findings with substantial evidence but provides no specific evidence to support this claim. Similarly, the comment notes that when new substantial evidence shows that an impact identified as less than significant in the Draft EIR has the potential to be significant, the EIR must consider and resolve the conflict in the evidence. However, the commenter provides no evidence that any of the less-than-significant impacts identified in the Draft EIR would be significant. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-12

The comment states that the Draft EIR failed to support its findings on GHG impacts with substantial evidence. The comment proceeded to cite the CEQA Guidelines with respect to analyzing GHG impact. The comment asserts that the cited sections of the CEQA Guidelines "tie qualitative measures to quantitative results." The comment also states that the Project's cumulative contribution should be discussed as part of the analysis. The comment does not directly challenge the contents of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-13

As stated in the City's General Plan Economic Development Element, the City seeks to enhance the quality of life for its residents by providing opportunities to work closer to home. Thus, the City has established a goal of a 2 to 1 jobs/housing balance and supports projects that would create two jobs for every new household.[12] Implementation of the Project would improve the City's job/housing balance to 1.23 to 1 or potentially up to 1.28 to 1 with the addition of indirect employment opportunities. Moreover, the Project would create jobs in the entertainment industry, which is one of the City's four targeted industry sectors. Thus, the Project would have a cumulative positive contribution to employment in the Santa Clarita Valley, which is considered one of the housing-rich areas of Los Angeles County, as it would create more high-quality jobs for the City's residents. With regard to the comment that the Project would be growth inducing, see Section 6.3, Growth Inducing Impacts, of the Draft EIR, which evaluated the Project's potential job creation and related growth inducement.

Response to Comment No. O5-14

The comment states that the Draft EIR failed to demonstrate consistency with the legislative plans identified as GHG reduction plans. By example, it states that it is unclear how such a large studio and facility with constant daily traffic is consistent with the City's General Plan Conservation and

[12] City of Santa Clarita, City of Santa Clarita General Plan – Economic Development Element, June 2011, p. 14.

Open Space Element Goal CO 8, which is intended for energy efficiency and reducing energy and natural resource consumption and reduce emissions of GHGs, as well as reaching targeted reductions of GHG emissions consistent with AB 32, SB 375, and other implementing regulations when the Project is going to increase emissions from its current use. Further, the comment alleges that the Draft EIR failed to explain how compliance with the RTP/SCS, Scoping Plan Update, Energy Plan, and General Plan led to a less-than-significant impact and specifically offsetting the increased GHG emissions due to the increased traffic in connection with the construction of the studio and the use of them indefinitely thereafter. It also suggests that the updates to the plans subsequent to the drafting of the Draft EIR were not accounted for.

The goal of the General Plan, as well as the Scoping Plan and RTP/SCS, is not to preclude new development or to provide a mechanism for offsetting all of the GHG emissions from new development implemented before there is sufficient technology and infrastructure available to do so. The goal of these plans is to provide a means for individual development projects to aid the State in moving towards the ultimate reduction goals. New land uses are not required to offset all new GHG emissions from the project, only to ensure that new projects are not conflicting with the measures implemented in the plans to reduce GHG emissions.

Pages 4.7-14 through 4.7-17 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR, identified Project-specific actions that would support the implementation of the identified plans. With respect to the specific example of Goal CO 8, the goal identifies several objectives and policies that would filter down to individual projects and their ability to comply, as shown on page 4.7-9 of the Draft EIR. As specifically stated on page 4.7-17 of the Draft EIR, Project-specific actions that would directly support the City's achievement of Goal CO 8 include "the Project would be required to comply with the applicable requirements of the CALGreen Code and California Energy Code, the City's Green Building Standards Code, and the City's Energy Conservation Code. The Project would be constructed in compliance with the 2022 Title 24 (CALGreen and Energy Code) standards and would be located within walking distance to the Jan Heidt Newhall Metrolink Station. In addition, the Project would include on-site amenities (private park, picnic areas, food truck stations), bicycle parking spaces, and electrical golf carts, which would contribute to vehicle trip reductions." These directly demonstrate what the Project includes to reduce GHG emissions consistent with what is identified in Goal CO 8.

Finally, with respect to the updates of GHG reduction programs/plans, the only plan updated subsequent to the initial draft of the GHG analysis was the 2022 Scoping Plan Update. The 2022 Scoping Plan Update and the Project's compliance with it are included in the GHG analysis on page 4.7-14 of the Draft EIR.

Response to Comment No. O5-15

The comment alleges that the Draft EIR failed to explain or analyze how compliance with the GHG Reduction Plan (page 4.7-6 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR) will lead to a less-than-significant impact. The comment further suggests that the lead agency should explain how implementing the particular requirements of the plan, regulation, or program ensures the Project's incremental contribution to the cumulative effect is not cumulatively considerable.

There are two GHG plans/regulations discussed on page 4.7-6 of the Draft EIR—the 2022 Update to the Climate Change Scoping Plan and Senate Bill (SB) 375 (2008 Sustainable Communities and Climate Protection Act). The Draft EIR addressed the Project's compliance with the 2022

Scoping Plan Update in detail on page 4.7-14. SB 375 requires CARB to develop regional GHG emissions reduction targets from passenger vehicles and directs the State's metropolitan planning organizations to prepare sustainable communities strategies. Pages 4.7-15 through 4.7-17 of the Draft EIR demonstrate compliance with the 2020-2045 RTP/SCS. As discussed in detail in Response to Comment No. O5-16 below, GHG emissions are cumulative by nature. These plans provide GHG emissions reductions through goals and policies that need to be met by the City and State to achieve the various reduction goals, which will ultimately contribute to the reduction of GHG emissions at the City and State levels. By demonstrating compliance with these cumulative plans, the Project ultimately would not contribute to a cumulatively considerable increase in GHG emissions.

Response to Comment No. O5-16

The comment contends that the Draft EIR failed to evaluate cumulative GHG impacts and that the Draft EIR needed to conduct an accurate cumulative GHG impact analysis. As stated on page 4.7-18 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR, "The geographic scope for related projects considered in the cumulative impact analysis for GHG emissions is global because impacts of climate change are experienced on a global scale regardless of the location of GHG emission sources. Therefore, GHG emissions and climate change are, by definition, cumulative impacts." As GHG emissions are inherently cumulative, the analysis of the Project as presented in the Draft EIR represents a cumulative analysis.

Response to Comment No. O5-17

The comment alleges that the Draft EIR was deficient related to deferral of mitigation, the exclusion of some sensitive receptors, the exclusion of sensitive receptors from the LST analysis, and a failure to analyze cumulative air quality impacts.

The Draft EIR does not defer mitigation; in the instance identified in the comment (Draft EIR p. 4.2-19), there are no potentially significant impacts identified, and, as such, no mitigation measures were required. The reference in the Draft EIR to the Project being required to comply with South Coast AQMD is not a reference to the formulation of mitigation measures but rather expressing that the Project is required to comply with South Cost AQMD's established rules and regulations.

As detailed in Response to Comment No. O5-7 above, the analysis adequately addresses sensitive receptors within a 1,000-foot radius of the Project Site and does not need to identify every receptor within the general area.

With respect to the comment's assertion that cumulative impacts are not properly addressed, the South Coast AQMD is the primary agency responsible for assuring that the National and California Ambient Air Quality Standards (NAAQS and CAAQS, respectively) are attained and maintained in their jurisdiction. In developing thresholds of significance for air pollutants, the South Coast AQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. As evaluated in the analysis of Threshold 4.2(b) on pages 4.2-19 through 4.2-21 in Section 4.2, Air Quality, of the Draft EIR, the Project would not exceed the South Coast AQMD's thresholds of significance. Consequently, the Project would not result in a cumulatively considerable increase in any air pollutants. The analysis of cumulative impacts

in the Draft EIR follows the methodology established by the South Coast AQMD. Therefore, no additional analysis to assess cumulative impacts is necessary or appropriate.

Response to Comment No. O5-18

The comment states that the analysis of construction and operational noise level increases in the Draft EIR is flawed because it only considered some nearby sensitive receptors. The comment asserts that the noise analysis in the Draft EIR is incomplete and potentially misleading because it omitted the list of additional sensitive receptors provided in the comment.

The sensitive receptors in the Draft EIR were chosen because they represented the closest sensitive receptors to the Project Site. In addition, the focus was on residential uses because they have the strictest noise standards within the SCMC. By analyzing these receptors and determining noise levels at these receptor locations that are lower than the City's noise standards, the public can interpret that sensitive receptors farther away would result in lower noise levels. Therefore, as with the closest sensitive receptors to the Project Site, noise impacts to sensitive receptors located farther away would also be less than significant. CEQA does not require an exhaustive list of potential sensitive receptors in a 1,000-foot radius if it is possible to interpolate potential noise impacts from the analysis of nearby sensitive receptors. For example, the comment references the Santa Clarita Motel, a commercial use that is located at a similar distance from the Project Site as Noise Receiver OFF9 (mobile home park to the west) in Table 4.11-3. This use would face similar noise levels from the Project but also has a higher noise standard per the SCMC of 80 dBA during the daytime and 70 dBA during the nighttime and, therefore, is exposed to noise levels much lower than the standards. Many of the sensitive receptors listed in the comment are much farther away from the Project (e.g., the Old Town Newhall Library located 1,000 feet to the south) and, due to distance attenuation and shielding from uses in between, would be exposed to negligible noise levels from the Project.

The comment makes particular note of Picasso's Playmates Creative Center. This use is approximately 100 feet south of the Project Site. The center is not a full school or daycare facility; its schedule posted on June 6, 2023, showed only five classes total for 1.5 hours each during a 7-day period.[13] In addition, as a commercial use, it would be subject to a higher noise standard per the SCMC of 80 dBA during the daytime. Even using the stricter residential daytime noise limit of 65 dBA, per Figure 4.11-3 in Section 4.11, Noise, of the Draft EIR, the center would be subject to operational noise levels of 40 dBA from the Project, which is well below the noise standards. Given the aforementioned, the Draft EIR is not incomplete and potentially misleading due to focusing on the nearest, most sensitive receptors.

Response to Comment No. O5-19

The comment states that the primary noise sources identified in the Draft EIR were vehicle traffic and railroad activity and asserts that the measurements taken during the early to mid-afternoon were not sufficient to fully analyze noise impacts, given that construction is expected to occur from 7:00 a.m. to 7:00 p.m. on weekdays and 8:00 a.m. to 6:00 p.m. on Saturdays. The comment states that "an agency may not avoid its responsibility to prepare proper environmental analysis by failing to gather relevant data."

[13] Picasso's Playmates Creative Center, Hours/Class Schedule, https://picassoplaymates.com/, accessed June 6, 2023.

The comment does not provide recommendations for what they believe would be the adequate amount of measurements. As discussed in Section 4.11, Noise, of the Draft EIR, six 15-minute ambient noise level measurements were taken over the course of 2.5 hours at and near the Project Site, covering sensitive receptor locations north, east, and west of the Project Site. These measurements captured a typical noise environment for a weekday at the Project Site and provided relevant data for the public to understand ambient noise conditions in the area. For example, the measurements provided context that the more developed, urban area to the west of the Project Site has a louder ambient noise level than the more suburban areas to the north and east. The comment also incorrectly states that the date measurements were sampled was not provided in the Draft EIR. As stated on page 4.11-5 in Section 4.11, Noise, of the Draft EIR, measurements were taken on November 18, 2021 (Thursday).

The comment restates multiple times that the Draft EIR did not look at all possible sensitive receptors. Please see Response to Comment No. O5-18, which addresses the analysis of other sensitive receptors.

The comment describes the size of the Project and infers in an overarching comment that the Project would result in significant and unavoidable noise impacts because of its large size. The comment also asserts that that the Draft EIR did not properly follow CEQA Guidelines Sections 15091 and 15093 to address the significant and potentially unavoidable noise impacts that would occur. As discussed in Section 4.11, Noise, of the Draft EIR, and the Project's Noise and Vibration Study provided as Appendix J of the Draft EIR, the analysis found that construction and operational noise and vibration impacts would be less than significant, contrary to the commenter's assertion. Therefore, CEQA Guidelines Sections 15091 and 15093 would not be applicable to the Project. Please see Section 4.11, Noise, and Appendix J of the Draft EIR for the substantial evidence to support the impact conclusions.

The comment also expresses concern that the noise generated by a massive film and television studio developed on a vacant site and the resulting traffic would result in significant noise impacts. Additionally, the commenter is concerned about the duration of Project construction. As previously stated, Section 4.11, Noise, and the Noise and Vibration Study concluded that all noise impacts would be less than significant.

The comment references nighttime construction work that is proposed; however, as stated in Section 4.11, Noise, of the Draft EIR, the Project would comply with the allowed construction hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturday pursuant to SCMC Section 11.44.080.

Lastly, the commenter claims that the Draft EIR minimizes noise impacts by focusing on the closest residences to the Project Site, thereby underestimating the impact on other areas. The comment's conclusion asserts that the Draft EIR's noise impact analysis is severely flawed, understated, and needs to be revised to comply with CEQA. The comment states that the missing information in the Draft EIR, which presents more severe impacts, warrants recirculation. Please see Response to Comment No. O5-18, which addresses the analysis of other sensitive receptors. As discussed above, the analyses in Section 4.11, Noise, of the Draft EIR and the Noise and Vibration Study are fully compliant with requirements of CEQA and found that construction and operational noise and vibration impacts would be less than significant based on substantial evidence. Accordingly, the Draft EIR analysis is not missing information that would result in severe impacts, and recirculation is not warranted.

Response to Comment No. O5-20

The comment asserts that the Draft EIR failed to adequately analyze hazards and hazardous materials impacts and that the Draft EIR relied on the Phase I Environmental Site Assessment (ESA) report prepared for the Project Site to assess the hazard and hazardous materials impacts. The Draft EIR properly utilized information presented in the Phase I ESA for the purpose of establishing baseline conditions, as well as identifying the historical uses of the Project Site and potential for environmental conditions to exist on-site and nearby sites.

The comment also claims that with no tailored analysis of transportation and use of hazardous materials, relying on overly-general regulatory requirements and guidelines is not sufficient to prevent significant adverse impacts. The comment proceeds to cite two cases related to the evaluation of risks to the environment and human health resulting from the use of pesticides and herbicides. As identified in Section 4.8, Hazards and Hazardous Materials, of the Draft EIR, Project construction and operation would involve the limited transport, storage, use, and disposal of hazardous materials related to typical construction practices and building/landscaping maintenance. Specifically, the Project may require the use of hazardous materials, including cleaning products; paints, solvents, adhesives, and other chemical materials used in building maintenance, interior improvements, and set building; automotive lubricants; small combustion engine fuels and lubricants; pesticides and herbicides; and electronic waste, all of which are typical of commercial land uses. As stated in the Draft EIR, level of hazardous materials usage required for a commercial development would not present a significant threat to the environment because the Project would not include the routine transport, use, or disposal of hazardous materials at volumes or concentrations that require special provisions, permits, or approvals, such as those required for certain industrial land uses or agricultural/forestry resources as addressed in the cited cases. Accordingly, unlike those projects, the Project would not involve the spraying of toxic chemicals (particularly on private property objected to by the land owner or occupant) or hazardous materials over a large area to eradicate pests or competing plant species that may have a potential impact on human health and sensitive biological resources.

In response to the comment regarding the failure of the Draft EIR to recognize the Project's location within 0.25 mile of an existing or planned school, the discussion of Project impacts under Threshold 4.8(c) on page 4.8-11 of the Draft EIR specifically identified Newhall Elementary School within 0.25 mile and Placerita Junior High School and William S. Hart High School within 0.30 mile of the Project Site. The discussion also included reference to the analysis of local concentration levels of air pollutants, which determined that emission levels during construction and operation of the Project at Newhall Elementary School, the closest school to the Project Site, would not result in hazardous conditions to nearby schools.

The comment also states that the Project Site's location in or near a very high fire hazard severity zone is critical, especially given that the Project Site is surrounded by sensitive receptors on all sides. It also mentions that, "despite several considerations that are not addressed in the DEIR, it nonetheless concludes less than significant impacts for fire hazard,… no impact to emergency facilities." Impacts involving wildland fires were addressed under Threshold 4.8(g) on pages 4.8-13 and 4.8-14 of the Draft EIR and extensively in Section 4.17, Wildfire, of the Draft EIR. The comment did not specify what several considerations were not addressed in the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

The Draft EIR fully disclosed the Project's impacts related to wildfire and hazard/hazardous materials, and recirculation is not warranted.

Response to Comment No. O5-21

The comment claims that the Draft EIR failed to adequately analyze significant traffic and transportation impacts and that the Project does not appear to meet the applicable threshold of significant. The comment also claims there is substantial evidence but does not provide any information to support this claim.

The Draft EIR transportation analysis followed the City's guidelines outlined in *Transportation Analysis Updates in Santa Clarita* (TAU), which establishes the procedures and thresholds for transportation analyses in the City.

Table 8 of the TAU contains the following thresholds for various project types:

> Residential Project — Project exceeds 15 percent below citywide Baseline VMT for Home-Based VMT per capita.
>
> Employment (Commercial or Industrial) Project — Project exceeds 15 percent below citywide Baseline VMT for Home-Based Work VMT per employee.
>
> Regional Retail Project — Project results in a net increase in total VMT in comparison to the citywide Baseline VMT.

The VMT analysis for the Project is summarized in the Transportation Assessment (Appendix L of the Draft EIR) on pages 47 through 50 and in Appendix C of the Transportation Assessment. The analysis followed the TAU and determined a Work VMT per employee of 14.0, which was consistent with the required threshold set forth in the TAU. Draft EIR comments appear to interpret this result as meaning that employees on average live 7 miles from the Project Site (half of 14.0 miles, which is the average work VMT per employee). However, the "work VMT per employee" is more than simply the calculation of the distance between the employee's home and workplace. First, the average work VMT per employee is calculated based on the "home-based work attraction" trip types, which are one-way trips. In other words, the distance of 14.0 miles is the average *one-way* VMT. Second, the calculation of the work VMT per employee also takes into account the employee mode split (i.e., the number of employees that utilize carpool, transit, bike, or walk).

A sample VMT calculation is presented below in **Table O5-21-1** to help demonstrate the relationship between employee trip length and VMT. The VMT calculation shows the employee trip distribution characteristics for a business with 10 employees. These 10 employees are spread out throughout the metropolitan region, living between 1 and 20 miles from their workplace. These employees live an average of 8.7 miles away from their workplace. When work VMT per employee is calculated from the average employee trip length, the mode of travel and the vehicle occupancy is taken into account. For example, **Table O5-21-1** shows that eight of the 10 employees get to work in an automobile (with six driving and two as passengers). One employee takes the bus to work and the employee who lives the closest to the workplace walks or bikes to work. The VMT is generated by the employees that drive their cars to work. The two employees that take the bus and walk/bike to work do not generate VMT because they are not driving a vehicle to work. Thus, in this example, the 10 employees live a total of 87 miles from work (at an average of 8.7 miles

each), but they generate an average of only 5.9 work VMT per employee for their cumulative home-to-work morning trip.

Table O5-21-1
EMPLOYEE VMT EXAMPLE

Employee	Distance Home to Work (miles)	Travel Mode	Vehicle Miles Traveled
1	13	Drive	13
2	2	Drive	2
3	13	Car Passenger	0
4	1	Walk/Bike	0
5	8	Drive	8
6	6	Drive	6
7	4	Bus	0
8	10	Car Passenger	0
9	20	Drive	20
10	10	Drive	10
Total	**87**		**59**
Average	87/10 = 8.7		59/10 = 5.9
Source: Gibson Transportation Consulting, Inc., 2023.			

In the case of the Project, as discussed in the Transportation Assessment (Appendix L of the Draft EIR), the Project would generate an average of 14.0 work VMT per employee, which coincidentally matches the TAU threshold of 14.0 VMT per employee for the City of Santa Clarita.

Further, although the Project would include a TDM Program, the VMT analysis in the Draft EIR did not account for the Project's TDM measures and is, therefore, conservative. The TDM Program would further reduce total VMT and work VMT per employee.

The 2016 SCAG RTP/SCS Regional Travel Demand Model was the most recent model available when the Project analysis was underway and was approved for use in the study by the City.

The VMT analysis summarized in Table 10 on page 50 of the Transportation Assessment shows that the Project does not exceed the appropriate threshold of Work VMT per Employee and, therefore, does not have a significant VMT impact.

Response to Comment No. O5-22

The comment states that the Draft EIR used the Appendix G checklist of the CEQA Guidelines for the assessment of transportation impacts and found that there was no mitigation required for less-than-significant impacts related to conflicts with programs and plans or the VMT analysis and less-than-significant impacts with mitigation incorporated related to increasing hazards due to a geometric design feature and emergency access. Section 4.14, Transportation, of the Draft EIR determined that the Project's impacts related to conflicts with programs and plans, VMT analysis, increasing hazards due to a geometric design feature, and emergency access were all less than significant, and, as such, no mitigation measures are required. CEQA only requires mitigation measures if substantial evidence exists of potentially significant environmental impacts. In

particular, CEQA Guidelines Section 15126.4(a)(4)(A) states that there must be an essential nexus between the mitigation and a legitimate government interest (i.e., potential significant impact). It is not clear to which "less than significant impacts with mitigation incorporated to (c) and (d)" the comment was referring. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-23

The first part of the comment states that the Draft EIR offered vague assertions regarding compliance with existing policies for bicycle and pedestrian facilities and that the Project does not provide any direct transit service. Section 4.14, Transportation, of the Draft EIR, included a comprehensive discussion of bicycle, pedestrian, and transit facilities associated with the Project. More specifically, the discussion on page 4.14-16 of the Draft EIR states that "For bicyclists, the Project would provide a multi-use path on 13th Street along the Project frontage, bicycle parking, and end-of-trip facilities, including lockers and showers. In regard to pedestrians, the Project would provide … access to the Jan Heidt Newhall Metrolink Station, located less than 0.5 mile south of the Project Site." The Project would provide 170 bicycle parking spaces, including 145 long-term spaces and 25 short-term spaces. In addition, Section 4.10, Land Use and Planning, of the Draft EIR, provided a discussion of the Project Site as being well-served by a variety of nearby mass transit options, including rail and bus lines. The Project would promote walking and use of bicycles by constructing a Class I trail along the Project frontage at 12th Street, Arch Street, and 13th Street. In addition, the Project would be conditioned to either (1) pay an in-lieu fee to contribute toward improvements or (2) construct a connection to provide a link for pedestrians and bicyclists between the Project Site and the Jan Heidt Newhall Metrolink Station, which is located approximately 2,500 feet south of the Project Site and where there are stops for the Santa Clarita Transit (SCT), Amtrak Thruway Bus, and Antelope Valley Transit Authority (AVTA) services; and the Old Town Newhall dining and entertainment district.

The second part of the comment is related to the proximity of the Project Site to Fire Station 73. As acknowledged in Section 4.13, Public Services, of the Draft EIR, Project construction would result in temporary sidewalk and lane closures that may affect evacuation routes. However, construction would not impede the LACoFD from maintaining its response times. Furthermore, construction activities are temporary in nature and full access to all roadways would be restored upon completion of the Project. Project coordination with LACoFD has been on-going; LACoFD has not expressed any concerns regarding the Project's potential impacts to its access or emergency services.

The comment also mentions that "the only mitigation proposed fails to acknowledge the fire station and it is unclear how the emergency access mentioned would be tailored to the needs of Fire Station 73, and instead makes reference to access points that have yet to be constructed, which do not account for access needs prior to such improvements being made." It is not clear what mitigation is referred to in the comment and what access needs exist prior to implementation of Project improvements. Fire Station 73 is located on the west side of Railroad Avenue between 14th and 15th Streets, on the opposite side of the railroad tracks and Railroad Avenue from the Project Site. The Project would not include any road or lane closures in the vicinity of the Fire Station or any new driveways or other roadway, sidewalk, or bikeway improvements on the Fire Station's block. Please refer to Response to Comment No. A4-3 regarding the Project's compliance with all applicable LACoFD code and ordinance requirements for construction,

access, water mains, fire flows, and fire hydrants at LACoFD building plan check review and prior to the issuance of City of Santa Clarita building permits and certificates of occupancy.

Response to Comment No. O5-24

The comment asserts that because the surrounding sensitive receptors are significantly closer to the proposed Project's permanent operations and transportation use, the impacts to these receptors will be "drastically impacted compared to what is currently suggested and projected" in the Draft EIR. However, the comment does not identify a specific impact or which impacts the commenter believes would be greater than those disclosed in the Draft EIR or would result in significant and unavoidable impacts. All of the impact analyses contained in the Draft EIR complied with the requirements of CEQA Guidelines Section 15064 and were based on substantial evidence. Moreover, the presence of sensitive receptors in the vicinity of the Project Site was explained and considered throughout the environmental impact analysis in the Draft EIR, including in Sections 4.1, Aesthetics, 4.2, Air Quality, 4.8, Hazards and Hazardous Materials, 4.11, Noise, and 4.17, Wildfire. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-25

The comment makes unspecific claims that in light of the unsupported assertions made in the Draft EIR that the Project would require no mitigation because the impacts were found to be less than significant, the City is required to make a finding that there is no feasible way to lessen or avoid the significant effect or to make a statement of overriding considerations.

All of the impact analyses contained in the Draft EIR complied with the requirements of CEQA and CEQA Guidelines Section 15064 and were based on substantial evidence contained in the Draft EIR and its appendices, upon which the determination of less than significant with or without mitigation was made. As the EIR does not identify any environmental impacts of the Project to be significant and unavoidable, the comment regarding CEQA Guidelines Sections 15091 and 15093 is not relevant, and the City is not required to determine either that (a) there is no feasible way to lessen or avoid a significant effect or (b) to specifically identify expected benefits from the Project that will outweigh the significant environmental impacts of the Project. Pursuant to CEQA Guidelines Section 15064(f)(5), "argument, speculation, unsubstantiated opinion or narrative, or evidence that is clearly inaccurate or erroneous or evidence that is not credible, shall not constitute substantial evidence." The comment does not present (1) information or substantial evidence that any of the Project's environmental impacts would be significant and unavoidable, (2) evidence about any specific impact area that would require denial of the Project, or (3) any new information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-26

The comment states that given the Project's size, there is a strong likelihood that more special status species exist on the Project Site. The comment also states that the Draft EIR relies on several plant and animal surveys to gather evidence and that it is likely that circumstances have changed as to the presence of special status plant and animal species in eight years. The comment states that the City must reevaluate the possibility of special status plant species. The comment asserts that a large number of special status plants and animals are likely to be on the Project Site during construction and beyond and states that the Draft EIR's conclusions of no

significant impacts to special status plants or animals are unlikely to be accurate. The comment further states that mitigation proposed for impacts to sensitive vegetation and jurisdictional resources are proposed for some later time, which is disallowed under CEQA as deferred mitigation.

The comment is correct that the Draft EIR relies on numerous biological studies conducted on the Project Site, one of which dates back to 2015. However, the potential for special status plant and wildlife species to occur was evaluated following updated database queries and a field reconnaissance survey on January 20, 2022. The analysis was also informed by floristic rare plant surveys conducted within the Project Site in 2015, 2020, 2021 and 2022, as well as protocol burrowing owl and coastal California gnatcatcher surveys conducted between April and June 2022.[14,15] Accordingly, the Draft EIR's evaluation of special status plant and wildlife species potential to occur relied on data collected within the last year. The evaluation of existing conditions within the Project Site is valid as it is based on surveys conducted over multiple years, including multiple site surveys and database research conducted in 2022, around the time the baseline for the Draft EIR analysis was established with the publication of the Project's NOP. However, to be responsive to the commenter's concerns, an updated California Natural Diversity Database query was conducted to identify additional special status species added to the database following the January 2022 query. The only additional special status species identified by the query was Crotch's bumble bee. The updated query is included as **Attachment 4** to this Final EIR. Please see Response to Comment No. A1-5 for evaluation of Crotch's bumble bee, which was not a special status species at the time the Project's NOP was published but was reinstated as a candidate species for listing under the CESA by the California Fish and Game Commission on September 30, 2022. Please also see Response to Comment No. A1-9 for impacts to SSC species.

With regard to the comment's assertion that, "[w]hen mitigation is required or mentioned in the Draft EIR, much of it is proposed for some later time, which is disallowed under CEQA as deferred mitigation," it is unclear which mitigation measure(s) the comment is referring to. Mitigation Measure MM-BIO-1 identifies best management practices to be followed during construction, Mitigation Measure MM-BIO-2 requires a biological monitor to present during initial ground disturbance or vegetation removal activities, and Mitigation Measure MM-BIO-3 establishes requirements for the protection of nesting birds during construction. As these three mitigation measures establish specific procedures to be followed during construction, they cannot be implemented at this time but must occur during construction and are, thus, not improperly deferred. Mitigation Measures MM-BIO-4 and MM-BIO-5 establish minimum compensatory mitigation requirements for impacts to sensitive natural communities and jurisdictional areas and require the preparation of a Restoration Plan to identify specifically how the replacement habitat would be acquired/restored. Mitigation Measure MM-BIO-4 identifies the minimum content requirements for the Restoration Plan and Mitigation Measures MM-BIO-4 and MM-BIO-5 collectively require the Restoration Plan be approved by the California Department of Fish and Wildlife, the U.S. Army Corps of Engineers, and the Regional Water Quality Control Board prior

[14] Rincon Consultants, Inc., Burrowing Owl Habitat Assessment and Focused Survey Results for the Blackhall Studios Project, July 8, 2022 (see Appendix H of the Shadowbox Studios Project Biological Resources Assessment provided as Appendix D of the Draft EIR).

[15] Rincon Consultants, Inc., Blackhall Property Project Coastal California Gnatcatcher Focused Survey Report, May 26, 2022 (see Appendix I of the Shadowbox Studios Project Biological Resources Assessment provided as Appendix D of the Draft EIR).

to initiating construction or any site disturbance. As the mitigation measures included in the Draft EIR commit the Project to mitigating the potentially significant impacts and include specific performance standards that must be achieved, none of the mitigation measures are improperly deferred.

Response to Comment No. O5-27

The comment asserts that the Draft EIR errs in concluding consistency of its Land Use Analysis with the City's General Plan. The comment claims many instances of conflict between the applicable General Plan policies and the Project's consistency analysis.

In regard to the comment's claim that the Project is not an infill site, CEQA (PRC Section 21061.3) defines an infill site as follows:

> "Infill site" means a site in an urbanized area that meets either of the following criteria:
>
> (a) The site has not been previously developed for urban uses and both of the following apply:
>
> (1) The site is immediately adjacent to parcels that are developed with qualified urban uses, or at least 75 percent of the perimeter of the site adjoins parcels that are developed with qualified urban uses and the remaining 25 percent of the site adjoins parcels that have previously been developed for qualified urban uses.
>
> (2) No parcel within the site has been created within the past 10 years unless the parcel was created as a result of the plan of a redevelopment agency.
>
> (b) The site has been previously developed for qualified urban uses.

CEQA (PRC Section 21072) defines qualified urban uses as any residential, commercial, public institutional, transit or transportation passenger facility, or retail use, or any combination of these uses.

Based on these definitions, the Project Site is considered an infill site as it has not been previously developed for urban uses; it is immediately adjacent to qualified urban uses, specifically residential uses on the north and east, commercial uses to the south, and a mix of commercial and residential uses and the Metrolink right-of-way on the west; and no parcel within the Project Site has been created within the past 10 years.

A large portion of the Project Site, specifically south of Placerita Creek, has a General Plan designation and a corresponding zoning designation of MXN (Mixed Use Neighborhood), which allows for studio use with a Conditional Use Permit. Accordingly, development of the Project on a site designated and zoned for MXN would not result in urban sprawl and, as such, would not be inconsistent with Policy LU 1.1.3.

In regard to the comment about Placerita Creek, the Project does not propose any development in Placerita Creek. However, the Project proposes to stabilize the banks of Placerita Creek with buried rock bank protection that would be vegetated to maintain the natural appearance of the

creek; there would be no change to the existing floor of the creek bed, which would remain in its natural, soft bottom condition.

In regard to the comment about how the Project would be compatible with existing rural, equestrian, and National Forest land, as explained in the consistency analysis, the Project would be required to undergo several City processes prior to Project approval, including architectural design review, development review, landscape plan review, and hillside review, to ensure that the Project complies with the requirements of the Placerita Canyon Special Standards District and is compatible with the surrounding area, particularly the residential uses immediately east of the Project Site in Placerita Canyon. The Project would utilize the MWD right-of-way behind the residences that front on Alderbrook Drive as a plant nursery, which would provide both visual screening and an orderly transition between these residential uses and the Project. Finally, the Project site is not within or in proximity to a National Forest. As such, the Project would not be inconsistent with Policy LU 1.2.6.

In regard to the comment about the ridgeline, grading would be limited to the base of the ridgeline. The integrity and natural grade elevation of the ridgeline would be retained, and, as such, the Project would not be inconsistent with Policy LU 1.3.2.

Response to Comment No. O5-28

The comment asserts that the Project would not be consistent with Policy LU 2.2.1 and that it was a leap in logic to conclude that impacts to aesthetic quality would not be significant because Project development would not obstruct the entire view of the hillside. However, the comment does not provide specific reasons or provide substantial evidence that the aesthetic quality of the ridgeline would be diminished. As previously noted, the Project would not disturb the area beyond the base of the ridgeline north of Placerita Creek and would maintain the ridgeline as natural open space. As such, the Project would not be inconsistent with Policy LU 2.2.1.

The comment also questions the consistency analysis related to Policy LU 4.5.3, which promotes the inclusion of state-of-the-art technology within business complexes for telecommunications, heating and cooling, water and energy conservation, and other similar design features. The Project's compliance with the California Building Standards Code and the CALGreen Code would achieve the intent of the policy through the implementation of energy-efficient light fixtures and building materials and high-efficiency plumbing fixtures. As such, the Project would not be inconsistent with Policy LU 4.5.3.

In addition, the comment claims that the Draft EIR did not explain how the Project is consistent with Policies LU 5.2.3 and LU 6.4.1 and cites a case (*Sundstrom v County of Mendocino*) to suggest that the City has avoided its responsibility to prepare a proper environmental analysis by failing to gather relevant data. However, the comment does not provide specific reasons or provide substantial evidence that the City avoided its responsibility to comply with CEQA. Nonetheless, Policy LU 5.2.3 relates to locating non-polluting businesses that provide employment opportunities in proximity to neighborhoods to encourage walking to work. The Draft EIR referred to Policy LU 4.2.1, which relates to the pursuit of clean industries that provide opportunities for local residents. The consistency analysis provided for Policy 4.2.1 states that the Project would contribute to the expansion of clean industries (i.e., non-polluting businesses as mentioned in Policy LU 5.2.3) in the City that would provide job/employment opportunities for local residents. Similarly, Policy LU 6.4.1 relates to preservation of historic buildings, while Policy LU

2.2.2 (not Policy LU 2.2.1 as mentioned in the comment) relates to the preservation of the historical integrity of sites and areas with historical or cultural value to the community. The consistency analysis provided for Policy LU 2.2.2 states that the Project would not have direct or indirect impacts to any historical resources as no historic resources were identified on the Project Site and that no historic buildings are located in the immediate vicinity of the Project Site or have a direct line-of-sight of the Project Site. The discussions provided in Policies LU 4.2.1 and LU 2.2.2 were applicable and sufficiently addressed Policies LU 5.2.3 and LU 6.4.1, respectively.

Response to Comment No. O5-29

The comment questions whether "sustainable" and "adequate" are synonymous when discussing the Project's consistency with Policy LU 7.2.3. The water supply assessment (WSA) prepared by SCV Water for the Project included an additional analysis of its water supply reliability beyond the normal, single dry-year, and multiple dry-year analyses provided for in its 2020 Urban Water Management Plan (UWMP). This additional analysis was done with the 2021 update to SCV Water's Water Supply Reliability Plan. The Plan considered the anticipated increase in demand due to growth and climate change (through 2050). The Plan concluded that (1) current supplies along with active conservation would be sufficient until 2040, (2) additional investments in the programs and facilities identified in the UWMP would be sufficient to achieve reliability through 2050, and (3) alternative programs to those contained in the UWMP could offer different paths to achieve reliability or if implemented in addition to the UWMP could provide additional supplies in excess of demand. Accordingly, SCV Water concluded in its WSA for the Project that it "has evaluated the long-term water needs (water demand) within its service area and has compared these needs against existing and planned water supplies. Demand projections are based on applicable population projections and county and city land use plans, and account for conservation as well as climate change impacts and other relevant factors. This WSA concludes that the total projected water supplies available to the SCV Water service area over the 30-year projection during normal, single-dry, and multiple-dry year (5-year drought) periods are sufficient to meet the projected demands associated with the proposed Shadowbox Studios Development Project, in addition to existing and other planned future uses, including agricultural and industrial uses, throughout the Valley, provided that SCV Water continues to utilize available SWP Table A Amounts, and continues to incorporate conjunctive use (coordinated use of surface water and groundwater), water conservation, water transfers, recycled water, and water banking as part of the total water supply portfolio and management approach to long-term water supply planning and strategy."[16] Based on SCV Water's assessment and the Project's compliance with regulatory requirements related to water conservation, it could be inferred that SCV Water has demonstrated a sufficient and sustainable water supply to adequately serve the Project.

Response to Comment No. O5-30

The comment questions the Project's consistency with Policy LU 7.3.5. The comment notes that Policy LU 7.3.5 demands limited development within flood-prone areas. However, the comment fails to note the intent of the policy, which is to minimize downstream impacts. The consistency analysis provided a discussion of Project features, including proposed hydromodifications, to

[16] SCV Water, Water Supply Assessment – Shadowbox Studios Development, October 5, 2022, pp. 5-12 to 5-14.

minimize, if not avoid, downstream impacts. As such, the Project would not be inconsistent with Policy LU 7.3.5.

The comment also questions the Project's consistency with Policy LU 7.4.1, which requires the use of drought tolerant landscaping. The comment fails to acknowledge that the landscape plans and irrigation systems would be required to comply with the City's Design Guidelines and SCMC requirements. In addition, the WSA prepared by SCV Water considered landscape irrigation in the water demand estimates for the Project, as shown in Table 2-6 of the WSA (included in Appendix M of the Draft EIR). As such, the Project would not be inconsistent with Policy LU 7.4.1.

The comment also questions the Project's consistency with Policy C 3.1.1, which requires new development projects to implement trip reduction measures to relieve congestion and reduce air pollution from vehicle emissions. The comment claims that the Project will necessarily increase congestion and pollution but does not provide substantial evidence to support this claim. In addition to the Project's proximity to transit, including the Jan Heidt Newhall Metrolink Station approximately 2,500 feet south of the Project Site, the Project will incorporate several TDM features, including, but not limited to, bicycle parking and amenities, on-street bicycle facilities, and pedestrian network improvements, to contribute to the reduction in VMT and vehicle trips to and from the Project Site. These actions are consistent with City and State of California transportation and GHG policies and objectives. As such, the Project would not be inconsistent with Policy C 3.1.1.

Response to Comment No. O5-31

The comment claims that the policies identified in Comment Nos. O5-27 through O5-30 are a few examples of the Project's incongruous analysis of consistency with existing land use policies and that the Draft EIR should be revised to attend more closely to consistency between policies. Based on the discussions provided in Response to Comment Nos. O5-27 through O5-30, the Project would not be inconsistent with any of the policies mentioned in the comments, and no revisions to the Draft EIR are warranted.

Response to Comment No. O5-32

The comment contends that the Draft EIR failed to support its findings on energy impacts with substantial evidence. The comment cites portions of the CEQA Guidelines and alleges that the Draft EIR did not assess the use of energy in accordance with CEQA. The comment states that basing a project's energy impact on its compliance with the California Building Code is not an adequate analysis of energy and references a court case that found an energy analysis to be inadequate that relied on compliance with Title 24 but failed to assess transportation energy impacts and to address renewable energy impacts. The energy analysis in the Project's Draft EIR addressed both transportation and renewable energy along with compliance with Title 24.

The comment lists the following six criterion from Appendix F of the CEQA Guidelines that are used to inform an energy analysis:

1. The project's energy requirements and its energy use efficiencies;
2. The project's effects on local and regional energy supplies and on requirements for additional capacity;
3. The project's effects on peak-period and base-period energy demands;

4. The degree to which the project complies with existing energy standards;
5. The project's effects on energy resources; and
6. The project's projected transportation energy use and its overall use of efficient transportation alternatives.

The energy analysis in the Draft EIR accounts for all criteria based on the known Project information. For construction activities, with respect to Criteria 1, 2, 3, and 5, the analysis identified that the Project would consume 608,836 gallons of diesel fuel and 353,662 gallons of gasoline. Consumption in Los Angeles County in 2020 was 2,770 million gallons of gasoline and 299 million gallons of diesel fuel. The Project would consume less than 0.1 percent of the total 2020 consumption and would, therefore, not add excessive demand on the existing supply. With respect to Criterion 4, a construction contractor has not yet been identified for the Project, and, therefore, it would be speculative to specify the exact nature by which construction would comply with the regulatory requirements. However, regardless of the contractor, construction would be required to adhere to State and local requirements and regulations. Regarding Criterion 6 and construction transportation energy use, the use of Tier 3 equipment would make the equipment more efficient than the older Tier 1 or Tier 2 equipment, and compliance with fuel efficiency standards and idling prohibitions along with diversion of construction debris would result in the efficient use of energy necessary to construct the Project.

For operational activities, with respect to Criteria 1 2, 3, and 5, operations would require approximately 1,088,710 gallons of gasoline and 192,858 gallons of diesel for transportation fuels, 8,460,355 kilowatt-hours (kWh) of electricity, and 37,009 therms of natural gas. This would result in less than 1 percent of the County's gasoline or diesel use, 0.01 percent of Southern California Edison's (SCE) total electricity demand, and less than 0.01 percent of Southern California Gas Company's (SoCalGas) demand. The Project would not result in energy demand that would exceed current supply. With respect to Criterion 4, the analysis summarizes how the Project would comply with the 2022 California Energy Code and the CALGreen Code in addition to installing photovoltaic (PV) systems and solar panels which would offset the Project's energy demand by producing renewable energy on-site. The evaluation of Criterion 6 on page 4.5-11 in Section 4.5, Energy, of the Draft EIR, quantified energy consumption and explained that Project amenities, such as bicycle parking/facilities, EV charging infrastructure, and proximity to public transit, would reduce the transportation fuel consumption by encouraging the use of alternative transportation methods.

As summarized above, the Draft EIR adequately addressed all of the criteria identified in the comment, and the analysis supports the Draft EIR's conclusion that the Project would not result in significant impacts related to energy.

Response to Comment No. O5-33

The comment asserts that the Draft EIR should be recirculated because it lacked an adequate Project Description. The comment cites CEQA Guidelines Section 15124, which identifies the required information in the description of a project. Page 2.0-1 in Section 2.0, Project Description, of the Draft EIR, clearly identified the precise location and boundaries of the Project Site. As stated, "the Project Site is located in the southwestern portion of Santa Clarita, in the Newhall community, approximately 2 miles east of Interstate 5 (I-5), 2 miles west of the Antelope Valley Freeway (State Route 14), and 2 miles south of the Santa Clara River…. the Project Site is

situated at the northeastern corner of Railroad Avenue and 13th Street and bounded by 12th Street, Arch Street, and 13th Street on the south; a railroad right-of-way (ROW) and Railroad Avenue on the west; Metropolitan Water District (MWD) ROW on the east; and slopes maintained by the adjacent residential uses to the north." These descriptions were supplemented by Figure 2-1, Regional Location Map, and Figure 2-2, Project Vicinity Map, pursuant to CEQA Guidelines Section 15124(a). A clearly written statement of objectives sought by the Project, along with the underlying purpose of the Project, were included on pages 2.0-4 and 2.0-5 in Section 2.0, Project Description, of the Draft EIR, pursuant to CEQA Guidelines Section 15124(b). A description of the Project's characteristics, including its design and architecture related to the sound stage buildings, support building, office building and parking structure, catering and mechanical buildings, campus main entrance, open space and landscaping; parking, access, and availability of public transit in the Project area; lighting and signage; security features; off-site improvements; sustainability features; and anticipated construction activities and schedule were presented on pages 2.0-4 through 2.0-24, along with Figures 2-4 through 2-14 (site plan, elevation plans, conceptual landscape plans), in Section 2.0, Project Description of the Draft EIR, pursuant to CEQA Guidelines 15124(c). The requested permits and approvals from the City and other agencies were identified on pages 2.0-24 and 2.0-5 in Section 2.0, Project Description of the Draft EIR, pursuant to CEQA Guidelines 15124(d).

The comment presents no information or substantial evidence about the description of the Project that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-34

The comment asserts that the description of the Project did not satisfy the requirements of CEQA by failing to clearly include a statement of objectives. As identified in Response to Comment No. O5-33 above, a clearly written statement of objectives sought by the Project, along with the underlying purpose of the Project, were included on pages 2.0-4 and 2.0-5 in Section 2.0, Project Description, of the Draft EIR, pursuant to CEQA Guidelines Section 15124(b).

The comment also asserts that the Project improperly included some mitigation measures as PDFs to avoid the study of their impacts. As identified in Response to Comment No. O5-5, PDFs are features of the Project that would be included in the construction and operation of the Project that would be implemented above and beyond compliance with specific regulations and requirements. The description and inclusion of PDFs in the Draft EIR is not improper, as alleged by the commenter, but rather aids in fulfilling the required contents of an EIR. CEQA Guidelines Section 15126.4, in particular, expresses that an EIR should discuss "the measures which are proposed by project proponents to be included in the project."

Response to Comment No. O5-35

The comment claims that the Project is in violation of CEQA's piecemealing prohibition and cites several CEQA case law examples. The comment states that "the Project has incrementally expanded over time and will likely continue to expand give its proposed phases." It is not clear what the basis of this comment is as the Project has been downsized from its original proposal with 28 soundstages that would be constructed on the north and south sides of Placerita Creek and a six-level parking garage to 19 sound stages constructed on the south side of Placerita

Creek and a five-level parking garage. It is also not clear what is being piecemealed since the Project, as presented in the Draft EIR, has been analyzed as the "whole of an action" to be constructed in one phase. The Draft EIR also analyzed the proposed off-site improvements that would be necessary for the operation of the Project.

The comment presents no other information or substantial evidence about any specific impact area that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-36

The comment claims that because of the piecemealing, the CEQA analysis used an incorrect baseline that has been altered. The Notice of Preparation (NOP) for the Draft EIR was published on March 29, 2022, and the baseline conditions used in the CEQA analysis were established at that time, pursuant to CEQA Guidelines Section 15125.

The comment also claims that the applicant used various 2019 baselines and surveys through its 2019 approvals and cites several CEQA case law examples. It is not clear what Project approvals are being referred to as no entitlements or other approvals were issued in 2019 by the City that would allow the Project or any portion thereof to proceed.

The comment presents no other information or substantial evidence about any specific impact area that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-37

The comment states that an accurate, stable, and finite project description must be the subject of an EIR and cites several CEQA case law examples. As discussed in Response to Comment No. O5-33 above, the description of the Project presented in Section 2.0, Project Description, of the Draft EIR, complied with the requirements of the CEQA Guidelines and provided all the information specified in CEQA Guidelines Section 15124.

The comment presents no other information or substantial evidence about any specific impact area that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-38

As with Comment No. O5-35, the comment claims that the Project has been piecemealed by initially proposing a small scale project and will likely incrementally increase the cake and intensity of the Project. Please refer to Response to Comment No. O5-35 above.

Response to Comment No. O5-39

The comment claims that the Project violated the State planning and zoning laws, as well as the City's General Plan, and cites several CEQA case law examples.

The comment presents no other information or substantial evidence about any specific violation that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-40

The comment asserts that the proposed land use amendment and entitlements conflict with SB 375 and SCAG's 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) stating that SB 375 specifically targets GHG emissions from passenger vehicles by linking land use decisions to transportation planning. The comment further states that if the 2020-2045 RTP/SCS does not achieve CARB's GHG reduction targets, then the Metropolitan planning organization (MPO) is required to create an alternative planning strategy to show how the targets can be achieved through other mechanisms. Finally, the comment states that the applicable plan is the SCAG's 2020-2045 RTP/SCS plan adopted on September 3, 2020. This comment does not specifically address any portion of the Draft EIR and only provides background information on SB 375 and the 2020-2045 RTP/SCS. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-41

The comment alleges that the Draft EIR failed to demonstrate consistency with the most recent SCAG 2020-2045 RTP/SCS "given the many unverified and unanalyzed transportation impacts and the strong likelihood of increases to VMT rather than decreases due to the Project's development on land that consists mostly of parking spaces which will be replaced with substantial residential, commercial, and hotel uses, as well as no indication of transit discounts or improvements to accessibility to the Amtrak commuters during construction or how it impacts their commute or use after the Project's completion, or how the Project's significant patronage, resident, and hotel occupant increases would affect demand on the surrounding area and transportation networks."

The Project is the development of a film studio on currently vacant land. There would be no removal of existing parking or development of residential or hotel uses. The comment does not address the current Project identified in the Draft EIR. However, the Project's compliance with the 2020-2045 RTP/SCS is detailed in both Section 4.2, Air Quality, of the Draft EIR (page 4.2-18) and Section 4.7, Greenhouse Gas Emissions, of the Draft EIR (page 4.7-15). The details of the analysis identified the Project's VMT increases. The Project's demand on the transportation network was discussed in Section 4.14, Transportation, of the draft EIR (page 4.14-13). As demonstrated in these sections of the Draft EIR, the Project would be consistent with the 2020-2045 RTP/SCS.

Response to Comment No. O5-42

The comment requests that the City deny the Project and the Draft EIR and order the applicant to revise the Project to ensure consistency with all applicable laws and regulations, as well as study the "whole of an action." However, as discussed in the responses above, the Draft EIR fully complies with all requirements of CEQA and the CEQA Guidelines. The comment presents no other information or substantial evidence about any specific impact area that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for

recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O5-43

The comment discusses the potential reductions in VMT and, thereby, GHG emissions from including local hiring requirements. This comment does not address the Project or Draft EIR specifically. Thus, the comment does not identify an potential inadequacies of the Draft EIR but is rather intended to demonstrate how, in general, requiring local workers during construction could reduce GHG emissions. Accordingly, the comment is noted, and no additional response is warranted.

Re: Comments on Draft Environmental Impact Report for Shadowbox Studios Project (Master Case 21-109; SCH Number 2022030762)

Dear Mr. Crawford and Ms. Iverson:

We are writing on behalf of the Coalition for Responsible Equitable Economic Development Los Angeles ("CREED LA") to comment on the Draft Environmental Impact Report ("DEIR") prepared by the City of Santa Clarita ("City") for the Shadowbox Studios Project (Master Case 21-109) ("Project") proposed by L.A. Railroad 93, LLC ("Applicant").

The Project proposes to develop a full-service film and television studio campus that would consist of approximately 476,000-square feet of sound stages; approximately 571,000-square feet of workshops, warehouses, and support uses; approximately 210,000-square feet of production and administrative offices, and approximately 37,500-square feet of catering and specialty service areas. The approximately 93-acre Project site is generally located at the northeast corner of Railroad Avenue and 13th Street and bounded by 12th Street, Arch Street, and 13th Street on the south; Railroad Avenue on the west; Metropolitan Water District (MWD) right-of-way (ROW) on the east; and HOA maintained slopes associated with adjacent residential uses to the north. **O6-1**

Based on our review of the DEIR and available supporting documentation, we conclude that the DEIR fails to comply with the requirements of the California **O6-2**

printed on recycled paper

Environmental Quality Act ("CEQA")[1]. The DEIR fails to disclose and/or adequately analyze many of the Project's significant environmental impacts and fails to propose feasible and enforceable mitigation measures to reduce those impacts to a less than significant level, as required by CEQA.

As explained in these comments, there is substantial evidence that the Project will result in significant unmitigated impacts relating to air quality, health risks, noise, biological impacts, transportation and greenhouse gas ("GHG") emissions. The City may not approve the Project until it revises the DEIR to adequately analyze and mitigate the Project's significant direct, indirect and cumulative impacts and incorporates all feasible mitigation measures to avoid or minimize these impacts to the greatest extent feasible.

O6-2 Continued

We reviewed the DEIR, its technical appendices, and available reference documents with the assistance of air quality expert James Clark, noise expert Ani Toncheva, biological resources expert Shawn Smallwood, and transportation expert Norman Marshall. The comments and qualifications of these experts are attached hereto[2] and are incorporated by reference as if set forth herein. The City must respond to each expert's comments separately and fully.

O6-3

I. STATEMENT OF INTEREST

CREED LA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental and public service impacts of the Project. The coalition includes Santa Clarita residents Corey Wood, Greg Lewis and Michael de Francis, the Sheet Metal Workers Local 105, International Brotherhood of Electrical Workers Local 11, Southern California Pipe Trades District Council 16, and District Council of Iron Workers of the State of California, along with their

[2] **Exhibit A**, May 20, 2023 Letter from James J.J. Clark to Richard M. Franco, Adams Broadwell Joseph & Cardozo re: Comment Letter on Draft Environmental Impact Report (DEIR) Shadowbox Studios Project, SCH NO. 2022030762 (hereinafter "Clark Comments"); **Exhibit B**, May 19, 2023 Letter from Ani Toncheva, Wilson Ihrig to Richard M. Franco, Adams Broadwell Joseph & Cardozo re: City of Santa Clarita Shadowbox Studio Project Santa Clarita, California Review and Comment on DEIR (hereinafter "Toncheva Comments"); **Exhibit C**, May 18, 2023 Letter from Shawn Smallwood to Richard M. Franco, Adams Broadwell Joseph & Cardozo re: Shadowbox Studios Project (hereinafter "Smallwood Comments"); **Exhibit D**, May 19, 2023 Letter from Norman Marshall, Smart Mobility to Richard M. Franco re: Comments on the Shadowbox Studios Project (hereinafter "Marshall Comments").

printed on recycled paper

members, their families, and other individuals who live and work in the City of Santa Clarita and surrounding areas.

Individual members of CREED LA and its member organizations live, work, recreate, and raise their families in the City of Santa Clarita and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

O6-4 Continued

In addition, CREED LA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

II. LEGAL BACKGROUND

CEQA requires public agencies to analyze the potential environmental impacts of their proposed actions in an EIR.[3] "The foremost principle under CEQA is that the Legislature intended the act to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language."[4]

O6-5

CEQA has two primary purposes. First, CEQA is designed to inform decisionmakers and the public about the potential significant environmental effects of a project.[5] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'"[6] The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the

printed on recycled paper

public and its responsible officials to environmental changes before they have reached ecological points of no return."[7] As the CEQA Guidelines explain, "[t]he EIR serves not only to protect the environment but also to demonstrate to the public that it is being protected."[8]

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring consideration of environmentally superior alternatives and adoption of all feasible mitigation measures.[9] The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced."[10] If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[11]

O6-5
Continued

While courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference."[12] As the courts have explained, a prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process."[13] "The ultimate inquiry, as case law and the CEQA guidelines make clear, is whether the EIR includes enough

detail 'to enable who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'"[14]

O6-5
Continued

III. THE CITY FAILED TO PROVIDE TIMELY ACCESS TO DEIR REFERENCE DOCUMENTS, WHICH MAY NECESSITATE FURTHER COMMENT SUBMISSION

The City failed to make all documents referenced or relied upon in the DEIR available for public review during the DEIR's entire public comment period, thereby truncating the public comment period in violation of CEQA. As a result, CREED LA has been unable to fully analyze the DEIR and its supporting documents during the current public comment period. We therefore provide these preliminary comments on the DEIR and reserve our right to submit supplemental comments on the DEIR at a future date.

O6-6

On April 27, 2023, we submitted to the City a letter requesting access to "any and all documents referenced or relied upon" in the DEIR, excluding the DEIR and its appendices.[15] On May 8, the City responded that "you will be contacted on or before May 22, 2023 [i.e., the last day to submit public comments on the DEIR], with the availability of the records responsive and appropriate for disclosure."[16]

On May 12, 2023, we requested that the City extend the public comment period due to the City's failure to provide access to all of the DEIR reference documents.[17] The City did not respond substantively to the request for extension; rather, Community Development Director Jason Crawford responded via email "to confirm it has been received and will be included with the item for consideration of the Planning Commission at the 5/16 meeting."[18] Mr. Crawford's email was the first notification we received from the City that the Project was on the agenda for the May 16, 2023 Santa Clarita Planning Commission hearing, despite our previous written request for such notice.[19] On May 16, 2023, we reiterated our request for an

printed on recycled paper

extension of the DEIR public review and comment period in a letter to the Planning Commission,[20] and appeared in person at the Planning Commission hearing to make the same request. The Planning Commission took no formal action on our request for extension, meaning the public comment deadline remained May 22, 2023. Each of CREED LA's requests for extension were made pursuant to CEQA, which requires that "all documents referenced in the draft environmental impact report" be available for review and "readily accessible" during the entire comment period.[21]

Without access to the DEIR reference documents during the entire public comment period, CREED LA and other members of the public have been precluded from having a meaningful opportunity to comment on the DEIR as required by CEQA. Without access to these documents, CREED LA and other members of the public have been unable to fully evaluate the accuracy of the City's impact analysis, or the efficacy of the City's proposed mitigation measures.

O6-6
Continued

CEQA compels a lead agency to make all documents referenced in an environmental impact report "available for review" during the entire public comment period.[22] The courts have held that the failure to provide even a few pages of a CEQA document for a portion of the public review period invalidates the entire CEQA process, and that such a failure must be remedied by permitting additional public comment.[23] It is also well settled that a CEQA document may not rely on hidden studies or documents that are not provided to the public.[24]

On May 15, 2023, the City produced a number of the DEIR reference documents requested, with only a week remaining in the DEIR public comment period. This belated production deprived CREED LA of timely access to the documents, and did not cure the City's failure to make these documents available during the entire public comment period. By failing to make all documents and underlying data referenced in the DEIR readily available during the entirety of the public comment period, the City has denied CREED LA and members of the public the ability to meaningfully comment on the potentially significant environmental

printed on recycled paper

impacts of the Project in violation of CEQA's procedural mandates. Even with the belated document production, the size of the DEIR and the Project's complexity have made it difficult to effectively review and comment on the DEIR by the current comment deadline of May 22, 2023.

O6-6
Continued

IV. THE DEIR FAILS TO ADEQUATELY ESTABLISH THE EXISTING BASELINE FOR BIOLOGICAL RESOURCES IMPACTS

The DEIR contains serious flaws in its disclosure of baseline environmental conditions related to the presence of wildlife, including special status species, on the Project site. As a result, the DEIR lacks the necessary baseline information against which to measure the Project's impacts to biological resources.

The existing environmental setting is the starting point from which the lead agency must measure whether a proposed project may cause a significant environmental impact.[25] CEQA defines the environmental setting as the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, from both a local and regional perspective.[26] Describing the environmental setting accurately and completely for each environmental condition in the vicinity of the Project is critical to an accurate, meaningful evaluation of environmental impacts. The courts have clearly stated that "[b]efore the impacts of a project can be assessed and mitigation measures considered, an [environmental review document] must describe the existing environment. It is only against this baseline that any significant environmental effects can be determined."[27]

O6-7

Based on Dr. Smallwood's review of the DEIR and his associate's site visit, he found the DEIR's description of the Project site's baseline conditions to be deficient in several important respects.

First, the biological survey performed by the City's consultants on January 22, 2022 was incomplete and not fully documented. As Dr. Smallwood points out, the report setting forth the consultants' findings[28] lacks crucial information such as when the survey began and its duration. Without that context, it is difficult to assess the completeness of the survey effort. "Unreported and unknown to the

reader is whether the 23 species of vertebrate wildlife detected on site represented an impressive number after 15 minutes of survey or a dismal number after a day-long survey. Reporting that 23 species were detected in the absence of the context of survey effort is misleading."[29] By way of comparison, Dr. Smallwood's associate detected nearly twice this number of vertebrate wildlife in only 3.5 hours, using binoculars from locations around the site's perimeter.[30]

In addition, the City's consultant reported that 23 *additional* wildlife species were detected during separate surveys for burrowing owl and California gnatcatcher, but those additional sightings were not included in the DEIR, which reports that only 23 species *total* were detected.[31] "Considering the additional 14 species detected by [Dr. Smallwood's associate] on 14 May 2023, Rincon's reconnaissance survey detected only 38% of the 60 wildlife species that have been documented on site by surveys completed by professional biologists…"[32] The DEIR should be revised to report the total number of species detected on the Project site in order to provide a complete and accurate description of the existing environmental setting.

O6-7
Continued

Second, the focused detection surveys for burrowing owl and California gnatcatcher performed by the City's consultant fail to comply with minimum standards of the available survey protocols for these species. For example, the California gnatcatcher survey did not include any non-breeding season surveys as required by U.S. Fish and Wildlife Service ("USFWS") protocols.[33] The burrowing owl surveys failed to meet nearly half of the applicable California Department of Fish and Wildlife ("CDFW") survey and reporting protocols, which leads Dr. Smallwood to conclude that the burrowing owl surveys are unreliable and cannot support a determination that burrowing owl is absent from the Project site.[34] Burrowing owl surveys that do not follow official protocols do not demonstrate compliance with CEQA.[35] Accordingly, the DEIR's findings that "since burrowing owls and coastal California gnatcatchers were not detected at the Project Site or the areas immediately surrounding the Project Site during the focused species surveys,

printed on recycled paper

no impacts to these species would occur as a result of Project implementation"[36] is not supported by substantial evidence. O6-8 Continued

Finally, the DEIR's "desktop review" is incomplete and flawed. According to Dr. Smallwood, an important part of documenting a site's environmental setting includes literature and database review and consulting with local experts in order to inform and augment reconnaissance surveys and to help determine which protocol-level detection surveys should be conducted.[37] Here, Dr. Smallwood explains that the DEIR's desktop review is incomplete as it neglected readily available species occurrence databases and provides no evidence that any local experts were consulted for knowledge of occurrences of special status species in the Project area.[38] He also explains that the DEIR and the City's biological consultants misused the one database they did consult for this Project, the California Natural Diversity Database ("CNDDB"). The DEIR used the CNDDB to improperly screen out consideration of many special status species, a use for which it is not designed.[39] O6-9

Based on Dr. Smallwood's own database reviews and the various reported Project site visits, he concludes that 122 special status wildlife species occur near enough to the site to warrant analysis of their occurrence potential.[40] The DEIR addresses only 37 of these species, and uses flawed rationales in making occurrence likelihood determinations as to many species.[41] Dr. Smallwood's comments provide substantial evidence that the wildlife community at the Project site is richer than characterized by the DEIR, and more special status species occupy the site than disclosed by the DEIR.

The DEIR must be revised to provide accurate baseline information about the Project site's environmental setting with respect to biological resources to allow for an accurate impact analysis and mitigation plan for the Project. O6-10

V. THE DEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS TO AIR QUALITY AND HUMAN HEALTH O6-11

An EIR must fully disclose all potentially significant impacts of a Project, and implement all feasible mitigation to reduce those impacts to less than significant

[41] *Id.*, pgs. 21, 27-30.

printed on recycled paper

levels. The lead agency's significance determination with regard to each impact must be supported by accurate scientific and factual data.[42] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[43]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by CEQA.[44] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[45] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will 'determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements.'[46]

O6-11
Continued

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[47]

A. The DEIR Fails to Adequately Disclose and Mitigate the Project's Significant Air Quality Impacts.

Under CEQA, a project has significant impacts if it "[v]iolate[s] any air quality standard or contribute[s] substantially to an existing or projected air quality violation."[48] The South Coast Air Quality Management District ("SCAQMD" or "Air District") maintains thresholds of significance for criteria air pollutants that are to be used in determining the significance of a project's air quality impacts under CEQA.[49] The DEIR failed to fully analyze the Project's construction emissions by improperly applying mitigation measures to unmitigated emissions prior to making its significance determination. As a result, the DEIR fails to disclose that Project

printed on recycled paper

construction may result in significant emissions that exceed applicable Air District thresholds, resulting in significant, unmitigated air quality impacts.

1. The DEIR's Air Quality Impact Analysis Improperly Relies on Mitigated Emissions to Conclude that Construction Emissions Are Less Than Significant

The DEIR underestimates the significance of the Project's air quality impacts by using mitigated emissions for its initial significance determination. By applying emissions controls that will be applied as mitigation to the Project's unmitigated emissions, the DEIR "compress[es] the analysis of impacts and mitigation measures into a single issue,"[50] in violation of CEQA. This approach is prohibited by CEQA because it fails to inform the public of the true severity of an impact.

The DEIR relies on Project Design Features ("PDFs") that are intended to reduce construction emissions to support its conclusion that the emissions are less than significant. This approach incorrectly dismisses the significance of the Project's actual, unmitigated emissions. With regard to construction emissions, the DEIR improperly relies on PDF AQ-1 and PDF-AQ-2, which "propose" that the Project will use off-road diesel-powered construction equipment that meets or exceeds the CARB and USEPA Tier 3 off-road emissions standards with Level 3 diesel particulate filters or be alternatively (non-diesel) fueled to reduce diesel exhaust emissions during Project construction.[51]

O6-12
Continued

Critically, neither the DEIR nor the Air Quality technical report[52] it relies on, calculate or disclose the Project's unmitigated construction emissions (i.e., construction emissions before applying the PDFs.) The AQ/GHG Study makes clear that its modeled emissions for the Project only include estimated emissions with the PDFs applied, rather than first estimating unmitigated emissions without the PDFs applied.

> "Construction emissions were modeled in CalEEMod to start in April 2023 based on applicant provided information with completion anticipated in September 2025. Construction emissions associated with development of the proposed project were quantified by estimating the types and quantity of equipment that would be used on site during each of the construction phases, as provided by the model defaults. As a project design feature, off-road diesel-powered construction

[50] *Ibid.*
[51] DEIR, p. 4.2-18.
[52] DEIR, Appendix C Air Quality and Greenhouse Gas Emissions Study ("AQ/GHG Study").

printed on recycled paper

> equipment would meet or exceed the CARB and USEPA Tier 3 off-road emissions standards and be equipped with Level 3 diesel particulate filters at a minimum. Equipment may also be alternatively (non-diesel) fueled to reduce diesel exhaust emissions. Pursuant with applicant provided information, the CalEEMod equipment, greater than 50 horsepower, was changed to be equipped with CARB and USEPA rated Tier 3 engines with Level 3 diesel particulate filters."[53]

Without disclosing the Project's unmitigated construction emissions, the DEIR only discloses estimated emissions with the application of PDF-AQ-1 and PDF-AQ-2. This "downward adjustment" of the Project's construction emissions artificially reduces their significance. The DEIR concludes that the Project's construction emissions (mitigated by PDF-AQ-1 and PDF-AQ-2) are less than significant, without application of any binding mitigation measures.[54]

This approach violates CEQA. CEQA requires that an EIR disclose the significance of an impact prior to mitigation.[55] The purpose of this analysis is both to require public disclosure of a project's impacts, and to require the lead agency to "identify and focus on the significant environmental effects of the proposed project."[56] In evaluating the significance of an impact, an EIR must discuss the physical changes in the environment that the project will cause, including:

O6-12
Continued

> relevant specifics of the area, the resources involved, physical changes, alterations to ecological systems, and changes induced in population distribution, population concentration, the human use of the land (including commercial and residential development), health and safety problems caused by the physical changes, and other aspects of the resource base such as water, historical resources, scenic quality, and public services.[57]

Only after this discussion occurs may the agency identify and apply mitigation measures to reduce potentially significant impacts to less than significant levels.[58] The discussion is rendered meaningless (or, as here, omitted entirely) if the EIR falsely concludes that a project's impact is less than significant based on premature application of mitigation measures. In this case, the DEIR failed to undertake the requisite analysis required by CEQA Guidelines Section

printed on recycled paper

15126.2 for the Project's construction emissions because the DEIR did not disclose the Project's air quality impacts prior to incorporating PDF AQ-1 and PDF-AQ-2.

Moreover, none of these PDFs are incorporated into the DEIR as a binding mitigation measure, in further violation of CEQA. CEQA defines mitigation as including any measures designed to avoid, minimize, rectify, reduce, or compensate for a significant impact.[59] The PDFs described in the DEIR are actually mitigation measures because they perform these functions. For example, PDF AQ-1's requirement to use Tier 3 construction equipment is clearly designed as mitigation to reduce the Project's construction emissions that would result from using equipment with less efficient emissions controls. These PDFs are not designed to simply modify a physical element of the Project, as is inherent in a true project "design feature." Both PDFs are designed to reduce impacts. This makes them mitigation measures within the meaning of CEQA.

CEQA requires that mitigation measures be fully enforceable through permit conditions, agreements or other legally binding instruments.[60] Because the City has not characterized PDF AQ-1 or PDF AQ-2 as mitigation measures, they are not binding on the Applicant, and will not be included in the Project's Mitigation Monitoring and Reporting Program ("MMRP").[61] Reliance on "proposed" nonmandatory and unenforceable PDFs to reduce impacts therefore provides no assurance that the Applicant would later comply with the "design features." The PDFs therefore fail to provide the binding mechanism required by CEQA to compel the Applicant's compliance with mitigation following Project approval.

O6-12
Continued

The Court of Appeal recently reiterated that mitigation must be incorporated directly into a project's MMRP to be considered enforceable. In *Lotus v. Department of Transportation*,[62] an EIR approved by Caltrans contained several measures "[t]o help minimize potential stress on the redwood trees" during construction of a highway. Although those measures were clearly separate mitigation, the project proponents considered them "part of the project." The EIR concluded that due to the planned implementation of those measures, the project would not result in significant impacts. The Court disagreed, finding that the EIR had "disregard[ed] the requirements of CEQA" by "compressing the analysis of impacts and mitigation measures into a single issue." The Court continued, stating "[a]bsent a determination regarding the significance of the impacts … it is

printed on recycled paper

impossible to determine whether mitigation measures are required or to evaluate whether other more effective measures than those proposed should be considered."[63]

Similar to the inadequate analysis contained in the *Lotus* EIR, the DEIR asserts that incorporation of PDFs AQ-1 and AQ-2 would reduce the Project's air quality emissions to less than significant levels prior to mitigation. This approach improperly "compress[es] the analysis of impacts and mitigation measures into a single issue." Even if the DEIR's conclusions were accurate, which is unclear, the PDFs must be incorporated into the Project's MMRP as formal mitigation measures in order to be factored into the City's ultimate significance findings. "Simply stating that there will be no significant impacts because the project incorporates 'special construction techniques' is not adequate or permissible."[64]

O6-12 Continued

The City has a duty to disclose unmitigated emissions and compare them to the applicable significance thresholds before applying mitigation measures. As a result of its improper reliance on PDFs to achieve emissions reductions, the DEIR underestimates the amount of emissions that will be generated by the Project and their effects on nearby sensitive receptors. The DEIR must be revised and recirculated to include an accurate analysis of the Project's air quality impacts, and to require that any and all mitigation measures that are intended to reduce emissions are incorporated as binding mitigation in the Project's MMRP.

2. The DEIR Fails to Analyze and Mitigate the Project's Potentially Significant Health Impacts From Emissions

The DEIR's air quality analysis includes the conclusions that Project construction and operation will not expose nearby sensitive receptors to substantial pollutant concentrations, finding that such impacts will be less than significant without mitigation.[65] However, these conclusions are not supported by any analysis of the potential health risks of the Project's emissions to nearby residential receptors. The City's significance determination is not supported by accurate scientific and factual data, as required by CEQA.[66] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[67]

These standards apply to an agency's analysis of public health impacts of a project under CEQA. In *Sierra Club v. County of Fresno*, the California Supreme Court affirmed CEQA's mandate to protect public health and safety by holding that an EIR fails as an informational document when it fails to disclose the public health impacts from air pollutants that would be generated by a development project.[68] In *Sierra Club*, the Supreme Court held that the EIR for the Friant Ranch Project—a 942-acre master-planned, mixed-use development with 2,500 senior residential units, 250,000 square feet of commercial space, and open space on former agricultural land in north central Fresno County—was deficient as a matter of law in its informational discussion of air quality impacts as they relate to adverse human health effects.[69]

As the *Sierra Club* Court explained, "a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact."[70] The Court concluded that the County's EIR was inadequate for failing to disclose the nature and extent of public health impacts caused by the project's air pollution. As the Court explained, the EIR failed to comply with CEQA because after reading the EIR, "the public would have no idea of the health consequences that result when more pollutants are added to a nonattainment basin."[71] CEQA mandates discussion, supported by substantial evidence, of the nature and magnitude of impacts of air pollution on public health.[72]

O6-13
Continued

Furthermore, in *Berkeley Jets*, the Court of Appeal held that a CEQA document must analyze the impacts from human exposure to toxic substances.[73] In that case, the Port of Oakland approved a development plan for the Oakland International Airport.[74] The EIR admitted that the Project would result in an increase in the release of toxic air contaminants ("TACs") and adopted mitigation measures to reduce TAC emissions, but failed to quantify the severity of the

printed on recycled paper

Project's impacts on human health.[75] The Court held that mitigation alone was insufficient, and that the Port had a duty to analyze the health risks associated with exposure to TACs.[76] As the CEQA Guidelines explain, "[t]he EIR serves not only to protect the environment but also to demonstrate to the public that it is being protected."[77]

Here, the DEIR suggests that the City need not perform a health risk analysis based on its application of the South Coast Air Quality Management District's ("SCAQMD") localized significance thresholds ("LSTs") to analyze localized air quality impacts to sensitive receptors.[78] With respect to diesel particulate matter ("DPM"), which is a TAC, the DEIR finds that localized DPM emissions from Project construction are below the LST screening levels for $PM_{2.5}$.[79] The DEIR cites this finding in support of its conclusion that Project construction would not expose sensitive receptors to substantial TAC concentrations: "[a]lthough the localized analysis does not directly measure health risk impacts, it does provide data that can be used to evaluate the potential to cause health risk impacts."[80] The DEIR similarly uses LST screening levels to support the conclusion that Project operations would not expose sensitive receptors to substantial pollutant concentrations, leading to a finding that impacts would be less than significant.[81]

O6-13
Continued

The City's reliance on LSTs is misplaced, as the purpose of LSTs is not to provide health risk significance thresholds for TACs such as DPM, and therefore are not a proper metric to assess cancer risk from DPM exposure. Rather, LSTs by definition apply to criteria pollutants only and represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard, and are developed based on the ambient concentrations of that pollutant for each source receptor area.[82]

DPM is not a criteria pollutant for which there is an applicable federal or state ambient air quality standard. The seven criteria air pollutants are: ozone (03); carbon monoxide (CO); nitrogen dioxide (NO2); sulfur dioxide (SO2); PM10; PM2.5; and lead (Pb). Conversely, DPM is made of dozens of constituent particles that

printed on recycled paper

cause cancer. For example, the California Air Resources Board explains that DPM is composed of carbon particles and numerous organic compounds, including over 40 known cancer-causing organic substances.[83] Examples of these chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. Diesel exhaust also contains gaseous pollutants, including volatile organic compounds and oxides of nitrogen (NOx). LSTs do not quantify the toxic components of DPM or other TACs, nor do they compare them to SCAQMD's specific cancer risk threshold of 10 in one million. In sum, LSTs were not designed to assess the unique health risks of toxic air contaminants like DPM.

O6-13 Continued

Dr. Clark used the CalEEMod analysis outputs for the Project's operation phase to assess the cancer risk to nearby sensitive receptors from the Project's DPM emissions from Project's generators.[84] His analysis calculates the cancer risk at one of the several nearby residences to be approximately 20 in one million[85], greatly exceeding the 10 in one million significance threshold set by SCAQMD, resulting in a significant impact under CEQA.[86] The EIR's attempt to avoid performing an HRA for the Project based on LSTs is especially egregious in light of Dr. Clark's findings, which provide substantial evidence that the Project is likely to have significant health impacts. A revised EIR is required to fully disclose, analyze and mitigate these significant impacts.

Because the DEIR lacks any analysis disclosing health risks from exposure to DPM, it fails to meet CEQA's informational standards and the City's significance finding is not supported by substantial evidence. The City must prepare a revised EIR which includes an analysis of the Project's construction and operation health risks.

VI. THE DEIR FAILS TO ADEQUATELY DISCLOSE, ANALYZE AND MITIGATE SIGNIFICANT NOISE IMPACTS

O6-14

The DEIR's analysis of noise impacts is deficient in a number of ways and as a result, fails to disclose or mitigate significant impacts. Instead of applying the City's Noise Ordinance, the DEIR uses an improper significance threshold to assess the Project's construction noise impacts. The operational noise impact assessment is not supported by substantial evidence as the DEIR fails to disclose reference levels used in modeling noise levels. And the DEIR fails to analyze Project

[83] Clark Comments, pg. 5.
[84] Clark Comments, pgs. 6-9.
[85] *Id.*, pg. 9.
[86] *Schenck v. County of Sonoma* (2011) 198 Cal.App.4th 949, 960 (EIR must disclose an impact as significant when it exceeds a duly adopted CEQA significance threshold).

printed on recycled paper

construction and operational noise using an ambient-based threshold, in violation of CEQA.

A. Substantial Evidence Shows that the Project's Construction Noise Impacts Will be Significant and Unmitigated

The DEIR concludes that "because noise levels resulting from construction activities would be temporary and would comply with provisions in the City's Noise Ordinance, construction noise impacts resulting from the construction of the Project and off-site improvements would be less than significant."[87] This conclusion is faulty for several reasons.

As an initial matter, the fact that construction noise levels may be "temporary" does not support the conclusion that impacts would be less than significant. As the DEIR recognizes, the CEQA Guidelines state that a project's impacts are significant if it would "result in generation of a substantial *temporary* or permanent increase in ambient noise levels in the vicinity of project in excess of standards established in the local general plan or noise ordinance…[emphasis added]"[88] A substantial temporary increase in ambient noise is unquestionably a significant impact.

O6-14
Continued

Next, while the DEIR asserts that Project construction noise would "comply with provisions in the City's Noise Ordinance," that is demonstrably not the case. The Santa Clarita Municipal Code limits daytime noise in residential zones to 65 dB.[89] The DEIR states that over the course of a typical construction day, construction equipment would operate as close as 105 feet from adjacent sensitive noise receptors (residents) and that it is assumed that on average, construction equipment would operate at an average of 200 feet from such receptors.[90] The DEIR calculates that Project construction would generate a noise level of 70 dBA at a distance of 200 feet. This plainly does not comply with the 65 dBA daytime noise limit for residential receptors set forth in the City's Noise Ordinance.

In order to find no significant impact, the DEIR compares the Project's predicted 70 dBA construction noise to a different standard. It states that "[b]ased upon FTA Transit Noise and Vibration Impact Assessment criteria and because the adjacent properties are zoned residential, construction noise would be significant if noise levels exceed 80 dBA L_{eq} for an 8-hour period or construction is conducted

[87] DEIR, pg. 4.11-15.
[88] *Id.,* pg. 4.11-11; *see also*, CEQA Guidelines Appendix G.

[90] DEIR, pg. 4.11-15.

printed on recycled paper

outside the allowable hours for construction as stated in SCMC Section 11.44.080."[91] The DEIR fails to explain or justify why it applies the 80 dBA FTA standard rather than the 65 dBA limit in the City's Noise Ordinance. The DEIR further suggests that, so long as construction is only done within the hours permitted in section 11.44.080, the noise limits set forth in section 11.44.040 do not apply. Again, there is no discussion or justification given for this approach, and this interpretation is inconsistent with the plain language of the City's Noise Ordinance. Section 11.44.080 provides that "No person shall engage in any construction work which requires a building permit from the City on sites within three hundred (300) feet of a residentially zoned property except" during the specified hours—it does not exempt construction noise from the limits enumerated in section 11.44.040.

Finally, while the DEIR recognizes that under CEQA, noise impacts are significant if they represent a substantial increase above ambient levels, the DEIR completely omits any discussion of noise increases over ambient levels. As the DEIR recognizes, "a 5-dB change is generally recognized as a clearly discernible difference."[92] A 10 dB increase is judged by most people as a doubling of the sound level.[93] Measured ambient L_{eq} levels were 47-49 dBA at the residences closest residences to the east of the Project site, and even lower, 42-43 dBA at the residences to the north.[94] The DEIR's predicted construction noise levels of 70 dBA are more than 20 DB above ambient levels at those residential receptors and represent significant unmitigated impacts.

O6-14
Continued

The DEIR's failure to include any discussion, let alone analysis, of the increase in noise over ambient levels is a blatant violation of CEQA. CEQA requires agencies to conduct noise analyses for projects that consider both the absolute noise levels expected, and the degree noise levels are expected to increase. Noise studies that rely on a single measure that excludes possible significant impacts from noise increases or noise extremes do not receive deference by reviewing courts.

In *King & Gardiner Farms, LLC v. County of Kern*, the Court of Appeal held that an agency cannot simply rely on compliance with local noise regulations to conclude there will be no significant noise impacts without considering the impacts of increases in noise.[95] The County approved an EIR for proposed zoning

printed on recycled paper

amendments to streamline oil and gas permitting.[96] The EIR included an analysis of noise impacts that determined significance based solely on whether the 65 decibel day-night average ("dBA DNL") threshold in the County General Plan would be exceeded.[97] The Court of Appeal reasoned that the County General Plan did not conclude that all increases in the magnitude of noise are insignificant until the 65 dBA DNL threshold is exceeded, so the General Plan "does not constitute substantial evidence that the magnitude of an increase in ambient noise is irrelevant."[98] Rather, an EIR's noise analysis should consider both the increase in noise level and the absolute noise level associated with a project in determining the significance of the project's noise impacts.[99] The Court of Appeal concluded that an agency cannot exclusively rely on "a single cumulative DNL metric for determining the significance of the project's noise impacts" while deciding "the magnitude of the increase in ambient noise is irrelevant."[100]

O6-14
Continued

In *Berkeley Jets*, the Court of Appeal invalidated the Port of Oakland's EIR for expansion of the Oakland Airport because of its reliance on an improper noise standard.[101] The EIR evaluated the significance of noise impacts based on whether the estimated level of sound would exceed 65 dB Community Noise Equivalent Level ("CNEL").[102] However, as the Court of Appeal explained, the CNEL metric—which averages noise over the course of a day—could not be the sole indicator of significant effects from noise because it does not provide a meaningful analysis of the "degree single overflights will create noise levels over and above the existing ambient noise level at a given location, and the community reaction to aircraft noise, including sleep disturbance."[103] Therefore, the Court concluded, a revised EIR with additional study of noise impacts from flights was necessary.[104]

The City must revise the DEIR to address compliance with the noise limits set forth in its noise ordinance and to include an evaluation of the impact of increased noise levels attributable to Project construction and operations.

printed on recycled paper

B. The DEIR's Operational Noise Analysis Is Not Supported by Substantial Evidence and Does Not Comply With CEQA

As with the DEIR's construction noise analysis, the City has failed to analyze the Project's operational noise impacts using an ambient-based threshold and therefore violates CEQA. In addition, the DEIR lacks substantial evidence supporting its conclusion that the Project's operational noise impacts will be less than significant. As Ms. Toncheva explains, the DEIR's operational noise predictions were generated by SoundPLAN software, using its source database for parking lot, exhaust and HVAC sources.[105] The DEIR shows noise contours for operational noise from HVAC and exhaust point sources and parking lot area sources, and sets forth predicted operational noise levels at the sensitive receptors adjacent to the Project site.[106] However, the DEIR does not include the SoundPLAN reference levels used nor does it provide a detailed narrative of operational activities on the Project site, including schedule, making it impossible to fully evaluate the DEIR's operational noise analysis.[107] O6-15

For example, the DEIR shows a concrete wall around the perimeter of the Project site. Ms. Toncheva notes that while a solid barrier could provide 10-15 dB reduction in operational noise levels, the architectural renderings appear to show that the wall is not solid, which would dramatically reduce its effectiveness to a 5 dBA reduction.[108] "Based on the contours shown in Figure 4.11-3 and the receptor noise levels shown in Table 4.11-3**,** it appears the SoundPLAN model could be overestimating attenuation from the perimeter wall."[109]

Similarly, the DEIR shows a 45 dBA contour line around the sound stage building from rooftop mechanical equipment.[110] Ms. Toncheva reviewed the Noise Technical Report, which includes cut sheets for equipment planned for the Project site, including sound power levels of 77 dBA at 10 feet from the HVAC units.[111] Ms. Toncheva opines that it doesn't appear that these reference levels were used in the SoundPLAN model, and that it is unclear whether mechanical noise from the project would comply with the City's Noise Ordinance at nearby residences due to the lack of documentation of the SoundPLAN model.[112]

printed on recycled paper

It is well settled that a CEQA document may not rely on hidden studies or documents that are not provided to the public.[113] The DEIR's conclusions regarding the Project's operational noise impacts are therefore not supported by substantial evidence, requiring that the DEIR be revised and recirculated. O6-15 Continued

VII. THE DEIR FAILS TO ADEQUATELY DISCLOSE, ANALYZE AND MITIGATE IMPACTS TO BIOLOGICAL RESOURCES

Dr. Smallwood's comments explain in detail how the DEIR fails to adequately analyze several of the Project's potentially significant impacts on wildlife. The DEIR does not assess the Project's impacts on habitat loss and fragmentation, fails to adequately address impacts on wildlife movement, and lacks any discussion of the Project's threats to wildlife due to road mortality and window strikes. In addition, the DEIR's cumulative impacts analysis with respect to biological resources is wholly inadequate under CEQA. Finally, Dr. Smallwood explains how the DEIR lacks substantial evidence that the biological resource mitigation measures will reduce impacts to less than significant levels, and proposes additional feasible mitigation measures that the City must evaluate in a revised EIR. O6-16

A. The DEIR Fails to Analyze Potentially Significant Impacts to Wildlife

The DEIR purports to analyze whether the Project would have a substantial adverse effect, either directly or through habitat modifications, on any special status species.[114] As discussed above, the DEIR is deficient in its identification of special status wildlife species. Nevertheless, it recognizes that 47 special status wildlife species have been identified within a 5-mile radius of the Project site, seven have a moderate to high potential to occur on the site, and three have been observed on the site by the City's consultants.[115] The DEIR admits that potentially suitable habitat for these species exists on the Project site and that implementation of the Project would potentially impact existing habitat, which would cause potentially significant impacts.[116] Despite identifying potentially significant impacts, the DEIR omits any analysis of such impacts on wildlife habitat such as habitat loss and fragmentation.

---

[113] *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3rd 818, 831 ("Whatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what is lacking in the report.").
[114] DEIR, pg. 4.3-17.
[115] *Id.*, pg. 4.3-18.
[116] *Id.*

printed on recycled paper

Dr. Smallwood explains that the Project area has undergone severe habitat fragmentation, a process that poses significant threats to wildlife.[117] The Project would contribute further to habitat fragmentation by the loss of one of the region's last patches of undeveloped open space.[118] "Habitat loss not only results in the immediate numerical decline of wildlife, but it also results in permanent loss of productive capacity."[119] Dr. Smallwood expains the methods for estimating the loss of productive capacity that would be lost by development of the Project, and using published studies that measured bird nesting densities elsewhere he predicts the loss of 1,924 bird nests as a result of the Project's development.[120] In addition to the loss of nest sites, the reproductive capacity of the site would be greatly diminished because development will remove nest subtrate and foraging ground as the Site is graded and covered in impervious surfaces.[121] The DEIR lacks any analysis of, let alone mitigation for, these potentially significant impacts. The DEIR must be revised to analyze the Project's impacts to wildlife caused by habitat loss and fragmentation.

O6-16
Continued

The DEIR also purports to analyze whether the Project would interfere substantially with the movement of any wildlife species or with established wildlife corridors.[122] However, the DEIR only addresses the second part of the threshold (interference with wildlife corridors) and ignores the first part (interference with movement of wildlife species). The DEIR's narrow focus on "established wildlife corridors" ignores interference with wildlife movement generally. As Dr. Smallwood explains, "[a] site such as the proposed project site is critically important for wildlife movement because it composes an increasingly diminishing area of open space within a growing expanse of anthropogenic uses, forcing more species of volant [i.e., flying] wildlife to use the site for stopover and staging during migration, dispersal, and home range patrol."[123] The Project would cut off such wildlife from one of the last remaining stopover and staging opportunities in the Project area, forcing ever increasing travel between remaining stopover sites.[124] This represents an unexamined and unmitigated potentially significant impact that must be addressed in a revised EIR.

O6-17

Dr. Smallwood identifies two additional potentially significant impacts to wildlife that are completely ignored by the DEIR.

printed on recycled paper

First, the DEIR fails to consider the Project's impacts to animals crossing roads with significantly increased Project-generated traffic. Dr. Smallwood uses recent studies of traffic-caused wildlife mortality and the Project's vehicle miles traveled ("VMT") estimates to predict thousands of wildlife fatalities attributable to the Project each year.[125] These impacts are unexamined in the DEIR.

Second, Dr. Smallwood explains the known significant impacts on bird mortality from window collisions and the potentially significant impacts posed by the Project's office building which will include significant glass windows.[126] He reviews numerous studies of bird fatalities from collisions with windows, and predicts 120 annual bird deaths from window collisions on the Project site.[127] Like road mortality, these impacts are not discussed in the DEIR.

O6-17
Continued

Dr. Smallwood's comments are substantial evidence that the Project may cause significant unanalyzed and unmitigated impacts with respect to habitat fragmentation, wildlife movement, and wildlife mortality from road impacts and window collisions, and these impacts must be fully analyzed and mitigated in a revised DEIR.

B. The DEIR Fails to Analyze the Project's Cumulative Impacts to Wildlife

The DEIR lacks an adequate analysis of the Project's cumulative impacts on wildlife. As an initial matter, the DEIR incorrectly states the law with respect to CEQA's requirement that a project's cumulative impacts be analyzed. "Due to the site-specific nature of biological conditions…impacts to biological resources are typically assessed on a project-by-project basis rather than on a cumulative basis."[128] This is flatly contradicted by one of CEQA's mandatory requirements: "An EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable, as defined in [CEQA Guidelines] section 15065(a)(3)."[129] Section 15065(a)(3) requires that an EIR examine whether a project "has possible environmental effects that are individually limited but cumulatively considerable."[130] The DEIR's suggestion that impacts to biological resources need only be assessed on a project-by-project and not cumulatively is contradicted by CEQA's plain language.

[130] 14 CCR § 15065(a)(3).

printed on recycled paper

The DEIR does recognize that there are 36 related projects in the Project vicinity, that those projects "would result in the cumulative increase of urbanization and development in the region that would cause the loss of native vegetation, tree removal and reduction of open space," and that as a result, there would be less habitat available for protected species.[131] Rather than analyzing and mitigating these impacts, however, the DEIR goes on to state that, "as with the Project, related projects and other future development projects would be subject to established regulations pertaining to the protection of biological resources…."[132] The DEIR concludes that "[w]ith adherence to applicable regulations and any site-specific recommendations set forth in a site-specific biological resources assessment, the Project and related projects would not result in significant cumulative impacts related to biological resources."[133]

O6-18 Continued

The DEIR's conclusory statement that the Project would not result in significant cumulative impacts to biological resources is not supported by substantial evidence and ignores CEQA's mandates with respect to cumulative impacts analysis. Pursuant to CEQA Guidelines section 15064(h)(3), "[w]hen relying on a plan, regulation or program, the lead agency should explain how implementing the particular requirements in the plan, regulation or program ensure that the project's incremental contribution to the cumulative effect is not cumulatively considerable."[134] The DEIR provides no explanation of how the Project's compliance with regulations would ensure that the Project's contributions to cumulative impacts to biological resources would not be cumulatively considerable. The DEIR must be revised to include a proper analysis of the Project's potentially significant cumulative impacts to biological resources.

C. The DEIR's Mitigation Measures Are Inadequate to Address the Project's Significant Impacts to Biological Resources

Dr. Smallwood's comments explain why the DEIR biological resources mitigation measures will not reduce the Project's impacts to a level of insignificance.[135] In particular, he points out the following:

O6-19

- MM-BIO-1 requires that the Project implement a number of "best management practices during construction" that purport to reduce

[131] DEIR, pg. 4.3-25.

printed on recycled paper

impacts to special status species during construction.[136] These include limiting speed limits of construction vehicles, fencing or sloping of open trenches to prevent wildlife entrapment and removing food-related trash items from the Project site daily. As Dr. Smallwood points out, none of these "best management practices" would do anything to prevent further habitat fragmentation, reduce impacts to wildlife caused by Project-generated traffic or window collisions, or lessen the Project's interference with wildlife movement in the region.[137]

- MM-BIO-2 requires the presence of a qualified biological monitor be present on the Project site during initial ground disturbance or vegetation removal activities, with authority to temporarily stop work if any special status species are observed.[138] While Dr. Smallwood concurs that presence of a biological monitor onsite during Project construction is warranted, he states that this measure does nothing to address the Project's destruction of habitat and productive capacities of special status species, would not prevent further habitat fragmentation or reduce impacts of traffic and window collisions, nor would it mitigate the Project's interference with wildlife movement in the region.[139]
- MM-BIO-3 states that construction activities should occur outside of the bird breeding season to the extent practicable, and that construction activities within the breeding season be preceded by a nesting bird survey no more than 3 days prior to initiation of ground disturbance or vegetation removal.[140] Dr. Smallwood points out that this measure incorrectly states the duration of the bird breeding season recognized by California Department of Fish and Wildlife, and the DEIR should be revised accordingly.[141] He further points out that while pre-construction surveys for nesting birds are essential, they should be preceded by detection surveys to inform the preconstruction surveys of nesting locations.[142] Finally, Dr. Smallwood opines that MM-BIO-3 does nothing to mitigate the Project's destruction of habitat and productive capacity of birds that breed on site or to diminish the Project's impacts on habitat fragmentation.[143]

printed on recycled paper

Finally, Dr. Smallwood proposes several additional feasible mitigation measures to reduce the Project's potentially significant impacts.[144] These include measures to address wildlife mortality from road and window collisions. He also proposes that protocol-level detection surveys meeting minimum standards of available guidelines be required for multiple species, including burrowing owl and California gnatcatcher, as well as a suite of special-status species of bats.[145] Such surveys are needed to support negative findings of species where appropriate, inform pre-construction surveys to improve their efficacy, estimate Project impacts, and inform other necessary mitigation.[146] The City must evaluate and include all feasible mitigation measures, including those proposed by Dr. Smallwood, in a revised DEIR.

VIII. THE DEIR FAILS TO ADEQUATELY DISCLOSE, ANALYZE AND MITIGATE THE PROJECT'S TRANSPORTATION IMPACTS

The DEIR's transportation impacts analysis includes an estimate of the Project's expected home-based work vehicle miles traveled ("VMT") per employee.[147] The DEIR uses a significance threshold of 15 percent below the City's baseline VMT, which is asserted to be 21.0 VMT per person using base year 2012. The DEIR states that this threshold is 15.7.[148] The City's transportation consultant used the Southern California Association of Governments ("SCAG") 2016 RTP/SCS Regional Travel Demand Model to generate the Project's estimated VMT.[149] The DEIR asserts that such modeling calculated the Project's home-based work VMT per employee of 14.0, which is less than the adopted significance threshold of 15.7, and concludes therefore that the Project's VMT impacts are less than significant and require no mitigation.[150] CREED LA's transportation expert Norman Marshall finds a number of serious flaws in the DEIR's VMT analysis, and Mr. Marshall's comments provide substantial evidence that the Project's VMT impacts in fact are significant and require mitigation.[151]

O6-20

[145] *Id.*, pg. 42.
[146] *Id.*
[147] DEIR, pg. 4.14-18.
[148] *Id.;* note, however, that the DEIR's Appendix L (Transportation Assessment for Shadowbox Studios) sets forth a significance threshold of 17.9, which is in fact 15% below the City's purported 21.0 VMT for base year 2012. This discrepancy is not explained, and the DEIR should be revised to clarify its significance threshold and explain this discrepancy.
[149] See Appendix C to DEIR Appendix L, VMT Modeling Summary (Iteris, August 24, 2021).
[150] DEIR, pg. 4.14-18.
[151] *See generally,* Marshall Comments.

printed on recycled paper

First, Mr. Marshall identifies a basic discrepancy in the DEIR's analysis that calls into question the VMT modeling results. The DEIR's transportation assessment (Appendix L) includes a graphic clearly showing that the Project site is in an area of the City that has greater daily home based work VMT per employee than the City baseline.[152] This graphic was derived from the same SCAG model the City purportedly used to calculate the Project's VMT impacts.[153] As the same model was used both to create the graphic included in Appendix L and to estimate the Project's VMT impacts in the DEIR, Mr. Marshall expects that the result would be the same, i.e., that the Project's VMT would exceed the City's baseline VMT.[154] Instead, the analysis performed for the DEIR finds the opposite, i.e., that the Project's VMT is well below the City's baseline VMT. Mr. Marshall points out that this discrepancy is neither explained nor justified in the DEIR.[155]

Second, Mr. Marshall questions the validity of the DEIR's VMT analysis because it was performed using an outdated and unreliable model. The SCAG 2016 Travel Demand Model was replaced in 2020 with a newer and more complex regional travel demand model with a base year of 2016.[156] In addition to being out-of-date, Mr. Marshall explains that the SCAG 2016 model differs from the 2020 version in ways that are crucial to the DEIR's VMT impact analysis. As used in the DEIR, VMT represents average commute distances to and from the Project.[157] Both the 2016 and 2020 models used the 2011 California Household Travel Survey ("CHTS") in estimating commute trip length.[158] However, the 2020 model also incorporates census data in addition to CHTS data. As Mr. Marshall explains, the updated 2020 model reported that average commute distances across the entire region are 12.5 miles using the CHTS data and 20.6 miles using more reliable Census data.[159] The Census average commute data included in the 2020 model are therefore 65% higher than the average in the CHTS data used to calibrate the outdated 2016 model. "Any commute length estimates based on the outdated model, including those reported in the DEIR, significantly underestimate work trip VMT."[160] The 2020 model was available to the City's consultants well before the DEIR analysis was performed in August 2021.[161]

printed on recycled paper

Rather than relying on an outdated model based on data that underestimates commute trip lengths, Mr. Marshall opines that it is much more accurate to use actual data on commute trips taken from the census. He uses such data to estimate commute trip distances of workers in the Project area, and the result is a mean distance between work and home for Project area workers of 19.6 miles.[162] Because this is a one-way distance, he doubles that figure to represent round trip commutes, and further adjusts the figure to convert from straight line to road distances and to account for carpooling transit, walking and biking.[163] The resulting average is 38.7 VMT per worker per day, nearly triple the 14.0 VMT per day estimated by the DEIR using the outdated model.[164] (Note that this result is consistent with the DEIR graphic discussed above showing that average VMT in the Project area exceeds the City's baseline.) Mr. Marshall concludes "[t]here is no evidence that the outdated regional model with a base year of 2012 accurately represents commute trip lengths to the project area, and the model estimates are refuted by Census data. Therefore, it is irresponsible to rely on the model to claim that the project will not have significant VMT impacts."[165]

O6-20
Continued

Third, Mr. Marshall explains that the DEIR's VMT estimates are inconsistent with assumptions about Project trip lengths used in the CalEEMod modeling for the DEIR's GHG impacts analysis. As documented in DEIR Appendix C, the Project's GHG emissions were calculated using CalEEMod and are based on the number of trips times distance, i.e., VMT. The assumptions used in CalEEMod are inconsistent with those used in the transportation analysis. For example, the number of trips used in CalEEMod analysis (7,021.82)[166] is lower than the number of trips used in the transportation analysis (7,293).[167] Even more glaring, CalEEMod uses a default home-based work trip length of 16.6 miles, i.e., a roundtrip of 33.2 miles.[168] The inconsistency between the assumed Project trip length of 33.2 miles and the estimated Project VMT of 14.0 is neither explained nor justified.

For all of the foregoing reasons, the DEIR's VMT analysis is not based on substantial evidence, and the City must prepare a revised DEIR with a proper and supported VMT analysis.

IX. THE DEIR FAILS TO ADEQUATELY DISCLOSE, ANALYZE AND MITIGATE THE PROJECT'S GHG IMPACTS

The DEIR's GHG impacts analysis is based solely on a qualitative approach that purports to assess the Project's consistency with certain "plans and policies adopted for the purposes of reducing GHG emissions and mitigating the effects of climate change and the Project's ability to incorporate sustainable features in its design to reduce GHG emissions."[169] The DEIR relies on consistency with the California Air Resources Board ("CARB") 2022 Scoping Plan, SCAG's 2020-2045 RTP/SCS and the Santa Clarita General Plan. The DEIR includes a quantitative analysis of the Project's GHG emissions "for informational purposes," but does not use this assessment in its GHG impacts analysis based on the assertion that neither the City nor "any other State or applicable regional agency [has adopted] a numerical significance threshold for assessing GHG impacts that is applicable to the Project."[170] As discussed below, the DEIR's qualitative GHG impact assessment is not supported by substantial evidence and does not comply with CEQA. O6-21

The CEQA Guidelines allow, under certain circumstances, a lead agency to rely on a qualitative analysis or performance based standards to determine the significance of a Project's GHG impacts.[171] In doing so, the lead agency should consider the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional or local plan for the reduction or mitigation of GHG emissions.[172] "In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable."[173]

Furthermore, the CEQA Guidelines mandates that an environmental document, like the DEIR, that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify those requirements specified in the plan that apply to the project, and if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to

[169] DEIR, pg. 4.7-11.

[172] *Id.*
[173] 14 CCR § 15064.4(b)(3).

printed on recycled paper

the project.[174] The DEIR contains a cursory and incomplete analysis of the Project's compliance with the 2022 Scoping Plan, the SCAG RTP/SCS and the City's General Plan that fails to comply with CEQA's requirements.

A. The DEIR Does Not Demonstrate Compliance with the 2022 Scoping Plan

The DEIR identifies the 2022 Scoping Plan strategies applicable to the Project as including "reducing fossil fuel use, energy demand, and vehicle miles traveled (VMT); maximizing recycling and diversion from landfills; and increasing water conservation."[175] The DEIR claims compliance with these strategies largely through compliance with existing laws and regulations including the CALGreen Code and Building Energy Efficiency Standards.[176] These bare conclusions contain no analysis of "how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable."[177]

O6-21
Continued

The DEIR also claims that the Project is consistent with the 2022 Scoping Plan as it would reduce VMT and energy demand, thereby reducing GHG emissions.[178] However, as discussed herein, the DEIR's VMT and energy impacts conclusions are deficient and not supported by substantial evidence. Unless the City revises the DEIR to address the defects in those analyses, it cannot use a claimed reduction in VMT and energy demand as support for a finding that the Project will reduce GHG emissions.

Finally, the City claims compliance with the 2022 Scoping Plan by asserting that the Project will incorporate a "number of sustainable design features, including but not limited to installation of energy-efficient light fixtures, high-efficiency plumbing fixtures, EV parking spaces, and rooftop PV systems and solar panels."[179] While these design features may reduce energy consumption and GHG emissions, the DEIR contains no analysis supporting that contention. Moreover, the DEIR lacks any evidence that such features are mandatory, binding and enforceable, nor does the DEIR incorporate those features as mitigation measures applicable to the Project as required by CEQA Guidelines section 15183.5(b)(2).

printed on recycled paper

B. The DEIR Does Not Demonstrate Compliance with the SCAG RTP/SCS

The DEIR sets forth a number of GHG reduction strategies contained in SCAG's 2020-2045 RTP/SCS and asserts that the Project will be consistent with those strategies. However, the DEIR's analysis omits key facts that undermine its conclusions.

Among the SCAG GHG reduction strategies cited in the DEIR is to "focus growth near destinations and mobility options."[180] This strategy includes emphasizing land use patterns that facilitate multimodal access to work, expanding job opportunities near transit, encouraging design and transportation options that reduce reliance on and number of solo car trips and identifying ways to "right size" parking requirements and promoting alternative parking strategies.[181] The DEIR claims that the Project is consistent with each of these strategies, largely by pointing out that the Project will be near two bus stops, is a half-mile away from the nearest Metrolink station and will have 170 bicycle storage spaces on-site.[182] This analysis omits mention of the impacts of the Project on City employment, and the fact that it includes more parking spaces than projected on-site employees. The Project is expected to "generate direct employment for 2,333 persons and 3,500 additional indirect employment due to studio activities."[183] The Project will include a 1,072-space parking structure, approximately 455 surface parking spaces (including 221 vehicle parking spaces, 15 delivery van spaces and 219 trailer parking spaces), with an additional 1,157-space employee parking lot on the north side of Placerita Creek, for a total of 2,684 parking spaces on the Project site.[184] As the Project will have more parking spaces than expected employees, it plainly is not designed to encourage use of public transit or to reduce single car trips as set forth in SCAG's RTP/SCS.

O6-21
Continued

Additionally, the Project's projected employment by itself exceeds the SCAG forecast for all jobs in the City. The DEIR sets forth baseline (2022) and future (2026, i.e., expected Project buildout) employment projections for the City of Santa Clarita based on forecasts contained in SCAG's 2020-2045 RTP/SCS.[185] The DEIR reports a 2022 baseline of 94,097 jobs and a 2026 forecast of 96,028 jobs for the City.[186] This is a projected increase of 1,931 *total jobs in the City*, which is eclipsed

printed on recycled paper

by the 2,333 direct employees forecast for the Project alone. On the one hand, the DEIR claims the Project is consistent with SCAG's RTP/SCS and on the other hand ignores the Project's inconsistency with the job growth forecasts based on the very same plan.

C. The DEIR Does Not Demonstrate Compliance with the City's General Plan

The DEIR's analysis of consistency with the City's General Plan is entirely conclusory and lacks any of the analysis required by CEQA. The entirely of the "analysis" is set forth below:

> "The City's General Plan includes Goal CO 8, which is directed at improving energy efficiency, reducing energy and natural resource consumption, and reducing GHG emissions associated with development. The Project would be required to comply with the applicable requirements of the CALGreen Code and California Energy Code, the City's Green Building Standards Code, and the City's Energy Conservation Code. The Project would be constructed in compliance with the 2022 Title 24 (CALGreen and Energy Code) standards and would be located within walking distance to the Jan Heidt Newhall Metrolink Station. In addition, the Project would include on-site amenities (private park, picnic areas, food truck stations), bicycle parking spaces, and electrical golf carts, which would contribute to vehicle trip reductions. Therefore, the Project would be consistent with the applicable goals, objectives, and policies in the City's General Plan."[187]

O6-21
Continued

The DEIR doesn't even attempt to assess the Project's consistency with the numerous General Plan policies specifically designed to further Goal CO-8, which is to "improve energy efficiency, reduce energy and natural resource consumption, and reduce emissions of greenhouse gases."[188] The General Plan sets forth the following objective and polices in support of that goal:

Objective CO 8.3: Encourage the following green building and sustainable development practices on private development projects, to the extent reasonable and feasible.

- Policy CO 8.3.1: Evaluate site plans proposed for new development based on energy efficiency pursuant to LEED (Leadership in Energy

[187] DEIR, pg. 4.7-17.
[188] City of Santa Clarita General Plan, pg. CO-94.

printed on recycled paper

and Environmental Design) standards for New Construction and Neighborhood Development, including the following: a) location efficiency; b) environmental preservation; c) compact, complete, and connected neighborhoods; and d) resource efficiency, including use of recycled materials and water.

- Policy CO 8.3.2: Promote construction of energy efficient buildings through requirements for LEED certification or through comparable alternative requirements as adopted by local ordinance.
- Policy CO 8.3.3: Promote energy efficiency and water conservation upgrades to existing non-residential buildings at the time of major remodel or additions.
- Policy CO 8.3.4: Encourage new residential development to include on-site solar photovoltaic systems, or pre-wiring, in at least 50% of the residential units, in concert with other significant energy conservation efforts.
- Policy CO 8.3.5: Encourage on-site solar generation of electricity in new retail and office commercial buildings and associated parking lots, carports, and garages, in concert with other significant energy conservation efforts.
- Policy CO 8.3.6: Require new development to use passive solar heating and cooling techniques in building design and construction, which may include but are not limited to building orientation, clerestory windows, skylights, placement and type of windows, overhangs to shade doors and windows, and use of light colored roofs, shade trees, and paving materials.
- Policy CO 8.3.7: Encourage the use of trees and landscaping to reduce heating and cooling energy loads, through shading of buildings and parking lots.
- Policy CO 8.3.8: Encourage energy-conserving heating and cooling systems and appliances, and energy-efficiency in windows and insulation, in all new construction.
- Policy CO 8.3.9: Limit excessive lighting levels, and encourage a reduction of lighting when businesses are closed to a level required for security.
- Policy CO 8.3.10: Provide incentives and technical assistance for installation of energy-efficient improvements in existing and new buildings.
- Policy CO 8.3.11: Consider allowing carbon off-sets for large development projects, if appropriate, which may include funding off-site projects or purchase of credits for other forms of mitigation,

O6-21
Continued

printed on recycled paper

provided that any such mitigation shall be measurable and enforceable.

- Policy CO 8.3.12: Reduce extensive heat gain from paved surfaces through development standards wherever feasible.[189]

The DEIR makes no effort to assess the Project's consistency with any of these policies. As with the DEIR's cursory analysis of consistency with the 2022 Scoping Plan, it asserts that the Project will comply with green building standards and describes a handful of unenforceable project design features to support its conclusions regarding GHG impacts. While these design features may reduce energy consumption and GHG emissions, the DEIR fails to support that contention with analysis or evidence. Moreover, the DEIR lacks any evidence that such features are mandatory, binding and enforceable, nor does the DEIR incorporate those features as mitigation measures applicable to the Project as required by CEQA Guidelines section 15183.5(b)(2). O6-21 Continued

The City must revise and recirculate the DEIR with a proper analysis of the Project's GHG impacts.

X. THE DEIR IMPROPERLY INCLUDES A NUMBER OF UNENFORCEABLE AND NONMANDATORY PROJECT DESIGN FEATURES IN ITS ANALYSIS OF GEOLOGY, ENERGY, PUBLIC SERVICE AND WILDFIRE IMPACTS

As discussed at length in section V.A.1, above, the DEIR improperly relies on "proposed" and unenforceable project design features PDF-AQ-1 and PDF-AQ-2 to mitigate the Project's impacts prior to analyzing and disclosing those impacts, in violation of CEQA. The DEIR makes the same errors in applying PDFs to its geology, energy, public services and wildfire impacts analyses. For all of the reasons discussed above, this is a clear violation of CEQA's requirement that the DEIR disclose the Project's unmitigated impacts prior to applying mitigation. O6-22

A. The DEIR's Geology Impact Analysis Improperly Relies on Project Design Features to Conclude that the Project's Geology Impacts Are Less Than Significant

The DEIR includes proposed PDF-GEO-1 through PDF-GEO-7[190], which are derived from the City's consultant's geotechnical report.[191] Because these are not

[189] *Id.,* pgs. CO-96-97.
[190] DEIR, pg. 4.6-11—13.
[191] DEIR Appendix G.

printed on recycled paper

formal mitigation measures, these PDFs are neither mandatory nor enforceable. Nevertheless, the DEIR assumes that the PDFs will be implemented and will reduce the Project's impacts, and are used as supported for the conclusion that impacts will be less than significant. For example, in analyzing whether the Project would directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides, the DEIR states "the Project would implement Project Design Features PDF-GEO-1, PDF-GEO-2, PDF-GEO-3, and PDF-GEO-7 to ensure soil stability within the Project Site."[192] The DEIR concludes that potential impacts with regard to potential landslides are "less than significant without mitigation."[193] The DEIR similarly assumes the implementation of various PDFs to support its findings of no significant impact without mitigation with respect to seismic ground shaking, subsidence and expansive soils.[194]

O6-22
Continued

As with the DEIR's improper use of PDFs with respect to air quality impacts, the DEIR's geology impact analysis violates CEQA as it improperly "compress[es] the analysis of impacts and mitigation measures into a single issue."[195] The DEIR must be revised to assess and disclose the Project's geology impacts without consideration of the optional and unenforceable PDFs, and to require that any and all mitigation measures that are intended to reduce geology impacts are incorporated as binding mitigation in the Project's MMRP.

B. The DEIR's Energy Impact Analysis Improperly Relies on Project Design Features to Conclude that the Project's Energy Impacts Are Less Than Significant

O6-23

The DEIR states "no specific Project Design Features are proposed with respect to energy resources. However, Project Design Features PDF-GHG-1 and PDF-GHG-2 in Section 4.7, Greenhouse Gas Emissions, of this Draft EIR would reduce the Project's energy consumption."[196] As an initial matter, there is no PDF-GHG-2 in the DEIR, only PDF-GHG-1, which proposes that "[s]ubject to City and other agency approvals, rooftop photovoltaic (PV) systems and solar panels will be

[192] DEIR, pg. 4.6-14.
[193] *Id.,* pg. 4.6-15.
[194] DEIR, pgs. 4.6-13, 4.6-17 and 4.6-18.
[195] *Lotus, supra,* 223 Cal. App. 4th at 651-52
[196] DEIR, pg. 4.5-9.

printed on recycled paper

installed for all the sound stage buildings and the support building for localized use."[197]

With respect to whether Project would result in potentially significant impact due to wasteful, inefficient or unnecessary consumption of energy resources, the DEIR discusses energy use associated with transportation and includes the following statement: "the Project Site would provide EV charging stations and EV-ready parking spaces pursuant to Project Design Feature PDF-GHG-1, which would reduce fuel usage. Although the EV charging stations would represent an increase in electricity use, the resulting use of EVs would offset gasoline and/or diesel fuel consumption."[198] The DEIR concludes "[b]ased on the above, the Project would not involve the inefficient, wasteful and unnecessary use of energy during operation, and operational impacts would be less than significant."[199]

As set forth above, PDF-GHG-1 refers to rooftop solar, not EV chargers. The DEIR's reference to a nonexistent PDF relating to EV chargers makes it impossible to know what assumptions are being used to conclude that the Project will not involve the inefficient, wasteful and unnecessary use of energy. At a minimum, the DEIR must be revised to clarify this inconsistency.

O6-23
Continued

With respect to whether the Project would conflict with or obstruct a state or local plan for renewable energy or energy efficiency, the DEIR states "in accordance with PDF-GHG-1 and PDF-GHG-2, the Project Site would provide EV charging stations and EV-ready parking spaces pursuant to the requirements of the CALGreen Code, and install rooftop PV systems and solar panels for all the sound stage buildings and the support building for localized use. As the Project would be required to comply with these regulations, and would exceed the requirements of these regulations with the implementation of Project Design Features, the Project would not conflict with or obstruct state plans for renewable energy or energy efficiency."[200] Again, the DEIR inexplicably relies on a nonexistent PDF relating to EV chargers in its energy impact analysis. It also assumes the implementation of optional, unenforceable PDF-GHG-1 with respect to rooftop solar. It is also notable that the DEIR declined to consider PDF-GHG-1 in its GHG analysis, as "the amount of solar that will be incorporated based on Title 24 requirements is not known at this time."[201] Despite this uncertainty and the decision to not consider

---

[197] *Id.,* pg. 4.7-12. This PDF proposing rooftop solar was not incorporated into the GHG impact analysis because "the amount of solar that will be incorporated based on Title 24 requirements is not known at this time." DEIR, pg. 4.7-13 and Appendix C, pg. 41.

[200] *Id.*
[201] DEIR, pg. 4.7-13 and Appendix C, pg. 41.

printed on recycled paper

rooftop solar in its GHG analysis, the DEIR assumes the use of some undisclosed amount rooftop solar to support its conclusions regarding energy impacts.

For the reasons explained above, the DEIR must be revised to assess and disclose the Project's energy impacts without consideration of an uncertain, optional and unenforceable PDF, and to require that any and all mitigation measures that are intended to reduce energy impacts are incorporated as binding mitigation in the Project's MMRP. O6-23 Continued

C. The DEIR's Public Services Impact Analysis Improperly Relies on Project Design Features to Conclude that Project Impacts on Public Services Are Less Than Significant

The DEIR proposes PDF-PUB-1 through PDF-PUB-4 relating to fire department access and Project site security.[202] These PDFs are used to support findings that the Project would not result in significant impacts with respect to public services. For example, the DEIR states "[w]ith implementation of Project Design Features PDF-PUB-2 through PDF-PUB-4 and upon approval of required reviews and permits by the LASD, the Project, including the off-site improvements, would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection."[203] The DEIR therefore concludes that impacts with respect to police protection would be less than significant without mitigation.[204] The DEIR makes similar improper findings with respect to fire protection by assuming the implementation of PDF-PUB-1.[205] O6-24

For the reasons explained above, the DEIR must be revised to assess and disclose the Project's public services impacts without consideration of optional and unenforceable PDFs, and to require that any and all mitigation measures that are intended to reduce public service impacts are incorporated as binding mitigation in the Project's MMRP.

printed on recycled paper

D. The DEIR's Wildfire Impact Analysis Improperly Relies on Project Design Features to Conclude that Project Impacts on Wildfires Are Less Than Significant

The DEIR proposes PDF-WF-1 through WF-4 with respect to wildfire risk and hazards.[206] These PDFs are improperly used to support findings that the Project will not result in significant impacts with respect to wildfire risk.[207] For the reasons explained above, the DEIR must be revised to assess and disclose the Project's impacts with respect to wildfire without consideration of optional and unenforceable PDFs, and to require that any and all mitigation measures that are intended to reduce wildfire impacts are incorporated as binding mitigation in the Project's MMRP. O6-25

XI. CONCLUSION

For the reasons discussed above, the DEIR for the Project is wholly inadequate under CEQA. It must be revised to provide legally adequate analysis of, and mitigation for, all of the Project's potentially significant impacts. These revisions will necessarily require that the DEIR be recirculated for additional public review. Until the DEIR has been revised and recirculated, as described herein, the City may not lawfully approve the Project. O6-26

Thank you for your consideration of these comments. Please include them in the record of proceedings for the Project.

Sincerely,

Richard M. Franco

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Richard Franco

Subject: Comment Letter on Draft Environmental Impact Report (DEIR) Shadowbox Studios Project, SCH NO. 2022030762.

Dear Mr. Franco:

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the DEIR. If we do not comment on a specific item, this does not constitute acceptance of the item.

Project Description: O6-27

The Shadowbox Studios Project (Project) is proposed to be located in the southwestern portion of the City of Santa Clarita (City), in the Newhall community, approximately 2 miles east of Interstate 5 (I-5), 2 miles west of the Antelope Valley Freeway (State Route 14), and 2 miles south of the Santa Clara River. The Project Site is located at the northeastern corner of Railroad Avenue and 13th Street. The Project Site is bounded by 12th Street, Arch Street, and 13th Street on the south; a railroad right-of-way (ROW) and Railroad Avenue on the west; the Metropolitan Water District ROW on the east; and slopes maintained by residential properties to the north.

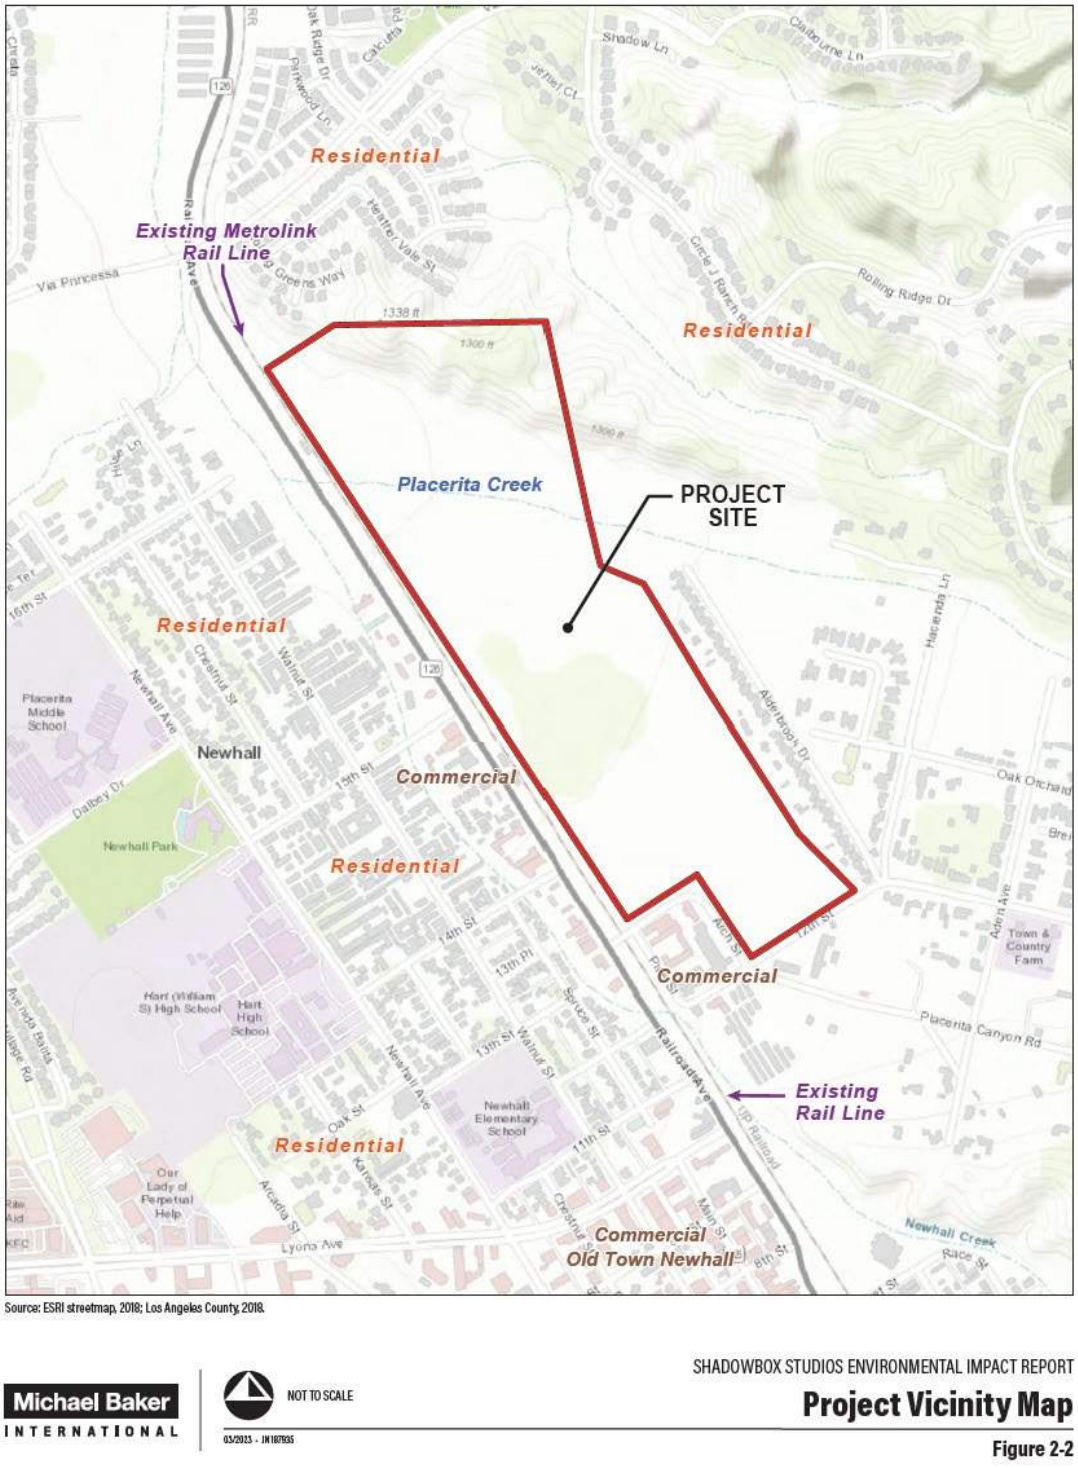

Figure 1: Project Vicinity Map

O6-27
Continued

According to the DEIR, the Project proposes to develop a full-service film and television studio campus on a vacant 93.5-acre site and would consist of approximately 475,500 square feet of sound

stages; approximately 565,400 square feet of workshops, warehouses, and support uses; approximately 209,300 square feet of production and administrative offices; and approximately 35,600 square feet of catering and other specialty services. Upon completion, the campus would have an overall building area of approximately 1,285,000 square feet.

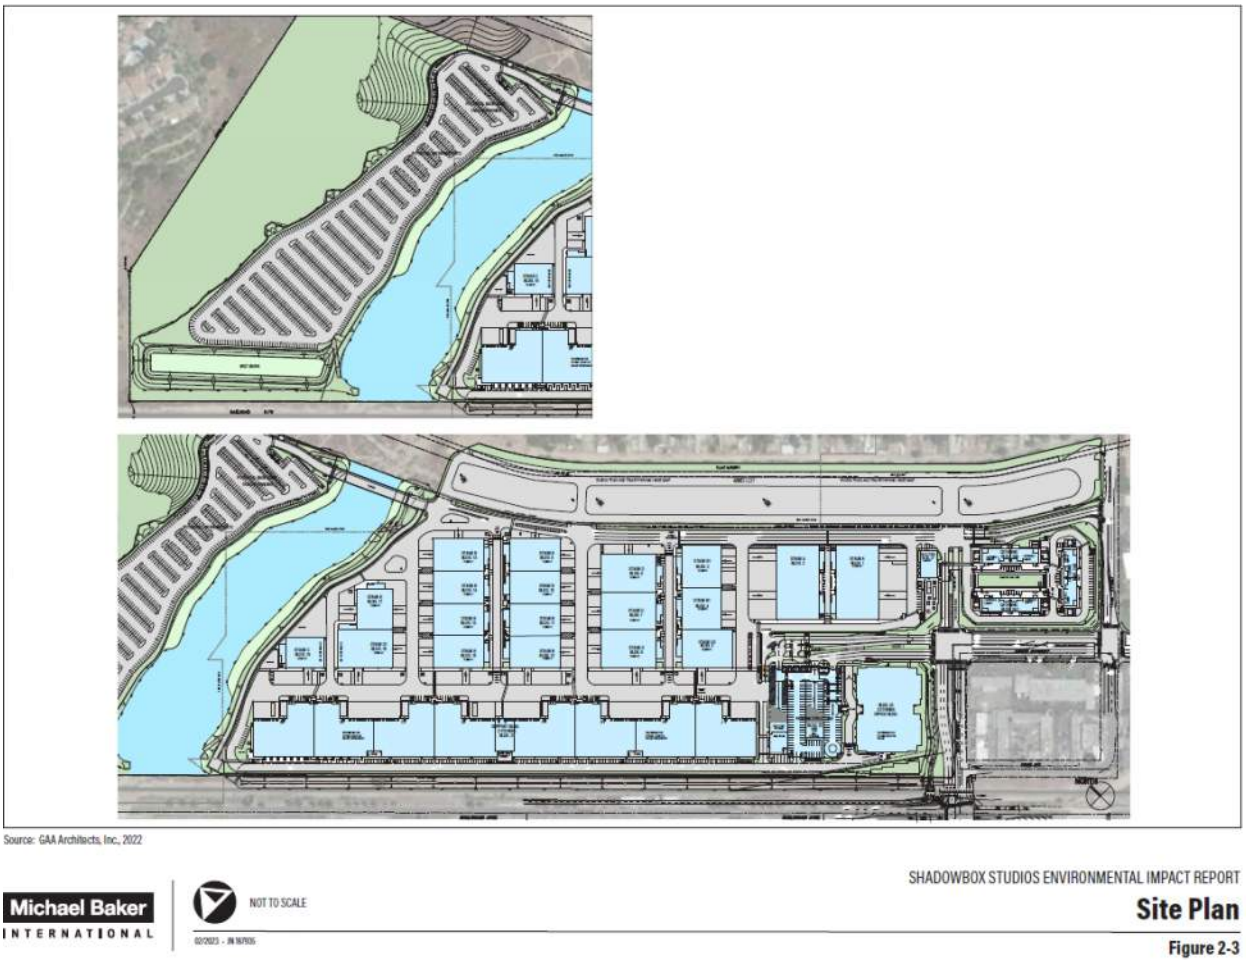

Figure 2: Project Site Plan

The Project would involve construction of 19 sound stages, a large support building, a parking structure, an office building, a catering building, and a mechanical building south of Placerita Creek. All 19 sound stage buildings would be situated in the center of the Project Site. The three-story office building and five-level parking structure are proposed at the northeastern corner of Railroad Avenue and 13th Street. The two-story support building would extend along Railroad Avenue south of Placerita Creek. Other proposed ancillary and specialty use buildings include a catering building, and a mechanical building with a substation located to the east and southeast of the main entrance at the intersection of Arch Street and 13th Street.

O6-27
Continued

The DEIR concludes that no mitigation is required to prevent impacts from the project on air quality in the area. This conclusion is in conflict with the facts provided within the DEIR. O6-28

Specific Comments:

1. The City's Air Quality Analysis Failed To Perform A Quantitative Health Risk Assessment Of The Impacts Of Toxic Air Contaminants (including Diesel Particulate Matter (DPM) and Other Air Toxins) Emissions From The Construction Phase Of The Project For The Nearest Sensitive Receptor(s)

In Appendix C to the DEIR[1], the City states in Impact AQ-3 that construction and operation of the project would not result in emissions of TACs (toxic air contaminants) sufficient to exceed applicable health risk criteria. According to Rincon, [2] the generation of DPM from construction projects occur in a single area for a short period. Construction of the proposed project would occur over approximately 29 months. O6-29

The assumption that a health risk analysis of the construction and operational emissions were below a significant level because local significant thresholds (LSTs) were not exceeded for pollutants being released from the Project is not valid. According to SCAQMD[3], LSTs are only applicable to criteria pollutants: oxides of nitrogen (NO_X), carbon monoxide (CO), particulate matter less than 10 microns in aerodynamic diameter (PM_{10}) and particulate matter less than 2.5 microns in aerodynamic diameter ($PM_{2.5}$), not to TACs. LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard, and are developed based on the ambient concentrations of that pollutant for each source receptor area and distance to the nearest sensitive receptor.

The City failed to perform any quantitative risk analysis, and therefore lacks supporting evidence for its conclusion that the Project would not result in significant health effects. The City's

[2] Rincon. 2023. Blackhall Studios-Santa Clarita Project Air Quality and Greenhouse Gas Emissions Study. February 2023. Pg 37

[3] http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/localized-significance-thresholds

failure to perform such an analysis is clearly a major flaw in the DEIR and may be placing the residents of the adjacent structures at risk from the construction and operational phases of the Project.

Under CEQA the City is required to provide a detailed health risk analysis for all projects that emit TACs with potential human exposure. TACs, including diesel particulate matter (DPM)[4], contribute to a host of respiratory impacts and may lead to the development of various cancers. Failing to quantify those impacts places the community at risk for unwanted adverse health impacts. *Even brief exposures to the TACs could lead to the development of adverse health impacts over the life of an individual*.

Diesel exhaust contains nearly 40 toxic substances, including TACs and may pose a serious public health risk for residents in the vicinity of the facility. TACs are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. The current California list of TACs includes approximately 200 compounds, including particulate emissions from diesel-fueled engines.

O6-29
Continued

Diesel exhaust has been linked to a range of serious health problems including an increase in respiratory disease, lung damage, cancer, and premature death.[5,6,7] Fine DPM is deposited deep in the lungs in the smallest airways and can result in increased respiratory symptoms and disease; decreased lung function, particularly in children and individuals with asthma; alterations in lung tissue and respiratory tract defense mechanisms; and premature death.[8] Exposure to DPM increases the risk of lung cancer. It also causes non-cancer effects including chronic bronchitis, inflammation of lung

[4] Because DPM is a TAC, it is a different air pollutant than criteria particulate matter (PM) emissions such as PM10, PM2.5, and fugitive dust. DPM exposure causes acute health effects that are different from the effects of exposure to PM alone.

tissue, thickening of the alveolar walls, immunological allergic reactions, and airway constriction.[9] DPM is a TAC that is recognized by state and federal agencies as causing severe health risk because it contains toxic materials, unlike $PM_{2.5}$ and PM_{10}.[10]

The inherent toxicity of the TACs requires the City to first quantify the concentration released into the environment at each of the sensitive receptor locations through air dispersion modeling, calculate the dose of each TAC at that location, and quantify the cancer risk and hazard index for each of the chemicals of concern. Following that analysis, then the City can make a determination of the relative significance of the emissions.

O6-29
Continued

According to the Operational Criteria Pollutant Emissions table from the Air Quality Analysis, the Project is expected to generate 0.9312 lbs of DPM exhaust per day from the generators. This equates to 0.2328 lbs of DPM per hour of operation of the generators. The assumptions buried in the DEIR are that the generators will run no more than 54 hours per year, equating to 12.5712 lbs per year of DPM or 0.0062856 tons of DPM per year.

[9] Findings of the Scientific Review Panel on The Report on Diesel Exhaust as adopted at the Panel's April 22, 1998 Meeting.

[10] Health & Safety Code § 39655(a) (defining "toxic air contaminant" as air pollutants "which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the federal act (42 U.S.C. Sec. 7412 (b)) is a toxic air contaminant.")

lbs/day = pounds per day; VOC = volatile organic compounds; NOx = nitrogen oxide; CO = carbon monoxide; SOx = sulfur oxide; PM_{10} = particulate matter with a diameter no more than 10 microns; $PM_{2.5}$ = particulate matter with a diameter no more than 2.5 microns

Notes: Some numbers may not add up precisely due to rounding considerations.

O6-29
Continued

Assuming that the sources of the DPM (the generators) are located near the center of the facility, it is possible to model the impacts on the residents immediately adjacent to the Project Site on Alderbrook Drive. Assuming that emissions are spread over the entire year, including weekdays and weekends, it is possible to calculate an averaged emissions of DPM in the community from the Project Site. Using AERMOD, the US EPA's preferred air dispersion model, it is possible to calculate the concentrations of DPM from the operational phase at the closest receptors located Alderbrook Drive and the other residences along Alderbrook. AERMOD is an acronym for the American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee's Dispersion Model. AERMOD contains the necessary algorithms to model air concentrations from a wide range of emission source types, including stack-based point sources,

fugitive area sources, and volume sources. The modeling domain with the building around the Project site are indicated in the figure below.

Figure 3: Model Domain

O6-29
Continued

Assuming an annual average emission of 0.0062856 tons of DPM per year from the generators, I have modeled the ground-level concentrations of DPM at the receptors indicated above. The maximum concentration modeled on an annual basis is 0.023 ug/m^3 of DPM.

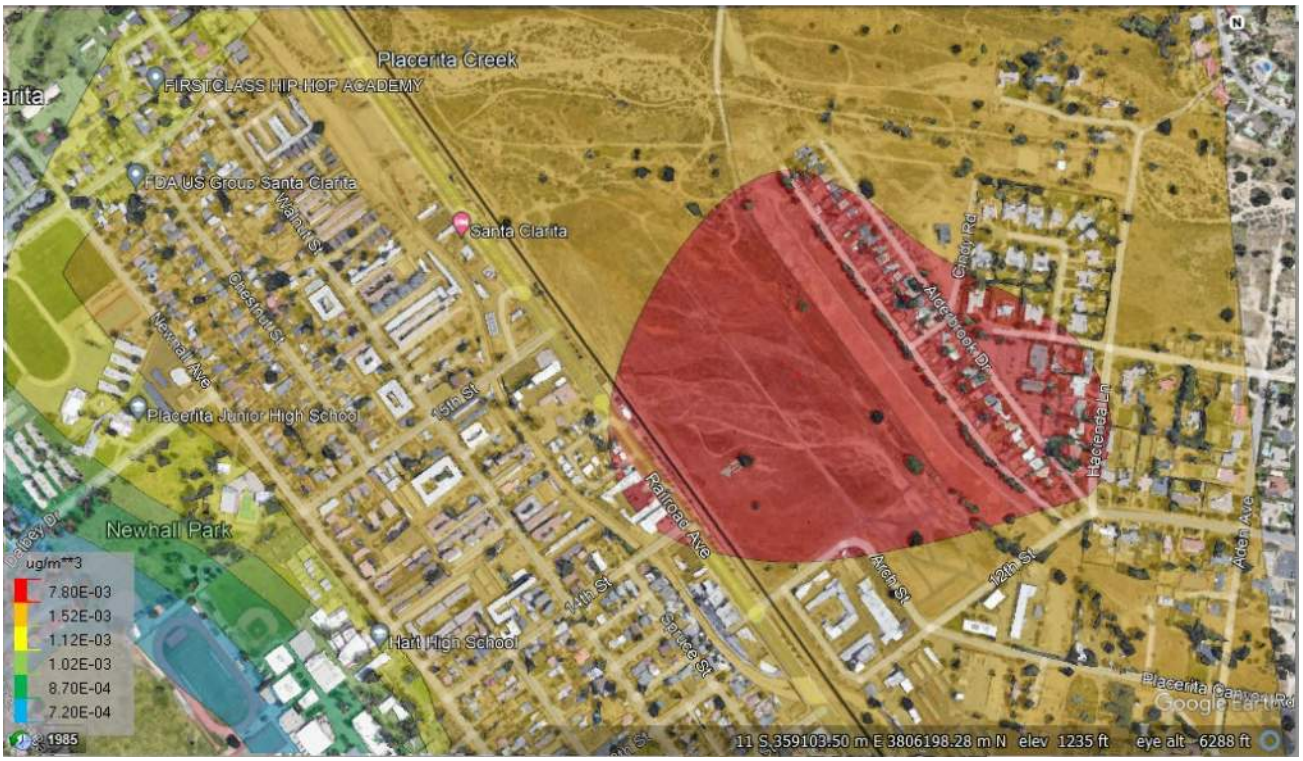

Figure 4: DPM Concentrations From Generators On Site

Using the OEHHA's HARP 2 Standalone Risk software, I calculated the cancer risk for the general population living at 16992 Abbey Lane. The cumulative risk for exposure to DPM for the operational phase was calculated to be 19.899 in 1,000,000, much greater than the 10 in 1,000,000 threshold outlined by SCAQMD resulting in a significant impact. The results of the air model and the health risk analysis are attached as an appendix to this letter.

By relying on the Air Quality Management Plan (AQMPs) control strategies for construction equipment and other activities to mitigate DPM emissions, and localized significance thresholds (LSTs) which analyze criteria pollutants but do not specifically evaluate TACs, the City cannot attest as to whether there is a cancer risk presented to the community by the Project. The City must address this concern by performing an air dispersion model of the sources on site and off site, quantify the annual concentrations of DPM for each of the receptors, perform a health risk assessment of the DPM concentrations consistent with the California Air Resources Board Toxic Hot Spot Guidance, and present the results in a revised DEIR.

O6-29
Continued

2. Air Quality Analysis Fails To Require The Use Of Tier 4 Final Technology For Off-Road Sources Of Diesel Exhaust On-Site.

As a project design feature (a non-enforceable control measure), the DEIR is claiming that off-road diesel-powered construction equipment would meet or exceed the CARB and USEPA Tier 3 off-road emissions standards and would be equipped with Level 3 diesel particulate filters at a minimum. The DIER fails to require that the best emission technology level, Tier 4 Final, be used on the construction equipment with a horsepower (hp) rating greater than 25 hp.

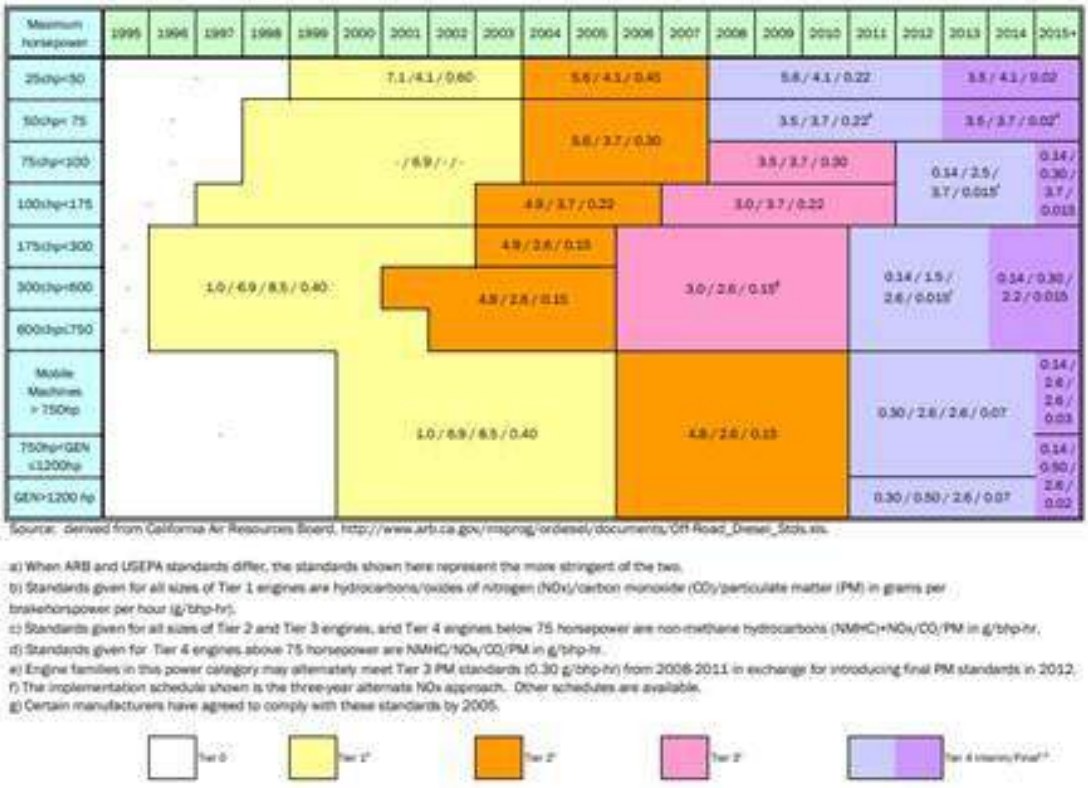
O6-30

Allowing the construction phase to use a lower tiered engine will produce more PM_{10} and $PM_{2.5}$ emissions than is generally acceptable for Projects being developed in the South Coast Air Basin.

The United States Environmental Protection Agency (U.S. EPA) and by agreement, CARB, have slowly adopted more stringent standards to lower the emissions from off-road construction equipment since 1994. Since 1994, Tier 1, Tier 2, Tier 3, Tier 4 Interim, and Tier 4 Final construction equipment have been phased in over time. Tier 4 Final represents the cleanest burning equipment and therefore has the lowest emissions compared to other tiers, including Tier 4 Interim equipment.[11]



Source: derived from California Air Resources Board, http://www.arb.ca.gov/msprog/ordiesel/documents/Off-Road_Diesel_Stds.xls.

a) When ARB and USEPA standards differ, the standards shown here represent the more stringent of the two.
b) Standards given for all sizes of Tier 1 engines are hydrocarbons/oxides of nitrogen (NOx)/carbon monoxide (CO)/particulate matter (PM) in grams per brake-horsepower per hour (g/bhp-hr).
c) Standards given for all sizes of Tier 2 and Tier 3 engines, and Tier 4 engines below 75 horsepower are non-methane hydrocarbons (NMHC)+NOx/CO/PM in g/bhp-hr.
d) Standards given for Tier 4 engines above 75 horsepower are NMHC/NOx/CO/PM in g/bhp-hr.
e) Engine families in this power category may alternately meet Tier 3 PM standards (0.30 g/bhp-hr) from 2006-2011 in exchange for introducing final PM standards in 2012.
f) The implementation schedule shown is the three-year alternate NOx approach. Other schedules are available.
g) Certain manufacturers have agreed to comply with these standards by 2005.

When Tier 3 equipment is compared to Tier 4 Interim and Tier 4 Final equipment it is clear that the use of Tier 3 equipment would put out substantially more particulate matter (PM_{10} and $PM_{2.5}$).[12] ***Tier 3 equipment puts out 80% to 89% more PM_{10} than Tier 4 Interim equipment and***

[12] "San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects." August 2015, *available at:* https://www.sfdph.org/dph/files/EHSdocs/AirQuality/San_Francisco_Clean_Construction_Ordinance_2015.pdf, p. 6.

85% to 91% more PM_{10} than Tier 4 Final equipment. Tier 3 equipment puts out 81% to 89% more $PM_{2.5}$ than Tier 4 Interim equipment and 85% to 92% more $PM_{2.5}$ than Tier 4 Final equipment.

O6-30 Continued

The City must revise the DEIR to first disclose the Project's unmitigated emissions and then address the efficacy of mitigation using Tier 3, Tier 4 interim, and Tier 4 final certified equipment and disclose the impacts that will have on the adjacent communities..

3. The City's DEIR Fails To Identify All Of The Sensitive Receptors Within a ¼ Mile Radius of the Project Site.

The City's DEIR fails to address the impacts that the Project will have on all nearby sensitive receptors. In the Air Quality Analysis the City states that "Sensitive receptors that may be affected by air quality impacts associated with project construction and operation include single family residences on Alderbrook Drive and Circle J Ranch Road along the eastern project site boundary, residential development south of Wiley Canyon Road/Via Princessa along the northern project site boundary, a mobile home park 180 feet west across Railroad Avenue, and residential developments 500 feet to the southeast and 500 feet to the west." [13]

O6-31

In addition to the residences adjacent to the Project Site, there are two schools within 0.3 miles of the Project. Placerita Junior High School and Hart High School are located less than 0.3 miles from the boundary of the Project.

[13] Rincon. 2023. Blackhall Studios-Santa Clarita Project Air Quality and Greenhouse Gas Emissions Study. February 2023. Pg 12

Figure 5: Project Site Location and Nearby Sensitive Receptors

O6-31
Continued

Given the volume of TACs that will be emitted during the construction and operational phases of the Project and the proximity of the Project to the receptors, the City must assess the impacts to each of these receptors using a quantitative risk analysis program to ensure that adequate mitigation measures are in place prior to start of the construction phase of the Project. The failure to assess the risk *a priori* is a critical flaw in the City's analysis.

4. The Air Quality Analysis Of Operational Emissions Is Incomplete And Fails To Include Emissions From The Fire Pump System That Will Be Installed Onsite.

O6-32

According to the operations air quality analysis of Project provided in the DEIR[14] operational emissions were calculated using the CalEEMOD (Version 2020.4.0) software. In the CalEEMOD

[14] Rincon. 2023. Blackhall Studios-Santa Clarita Project Air Quality and Greenhouse Gas Emissions Study. February 2023. Pg 36

outputs provided in the air quality analysis no fire pump system is included in the analyses. To be compliant with the California Fire Code (CFC) and local fire authorities, the Project will be required to install a fire pump system.

O6-32 Continued

The City's analysis is therefore incomplete and must be corrected in a revised DEIR for the Project.

5. The Greenhouse Gas (GHG) Analysis Attributes Reductions To Energy Use/Generator Over Time That Are Not Currently Achievable.

O6-33

Rincon's assessment of the GHG emissions and the reductions in GHG emissions that are predicated are based on a number of false premises. Firstly, the air quality analysis assumes that 8,627 MT CO_{2e} are attributable to mobile sources.

Table 12 Reduced Full Buildout Combined Annual Emissions

Emission Source	Annual Emissions (MT CO_2e)
Construction[1]	**196**
Operational	**7,056**
Area	<1
Energy	1,688
Additional RPS Reduction	(183)
Mobile	8,627
EV Charging Stations	(3,357)
Solid Waste	774
AB 341	(581)
Water	12
Generators	37
Food Trucks	39
Total	**7,252**

MT CO_2e = metric tons of carbon dioxide equivalent; parenthetical values represent negative numbers; values may not add directly due to rounding.

[1] Amortized construction related GHG emissions over 30 years

[2] Food Truck emissions account for electricity and waste emissions only. Mobile emissions are assumed to be part of the anticipated daily emissions quantifications and are included under mobile emissions.

Source: Appendix A CalEEMod worksheets

O6-33
Continued

The air quality analysis then assumes that installation of EV charging stations will reduce the GHG emissions from mobile sources by 3,357 MT CO_{2e}. This is based on 172 EV charging stations out of 3,435 total parking spaces.

Estimated GHG Emissions Reductions to replace gasoline vehicles with Electric Vehicles

		Conversion Factors:
Project Electricity Emission Factor[1]	0.14	2204.62 lb/MT
Electric Vehicle Fuel Economy[2]	0.25	1.00E-06 MT/gram
Gasoline CO_2e Emissions while Running[3]	249	0.001 MWh to KWh
Annual VMT Reduction per charging Station[4]	91,250	
Number of parking spaces	3,435	
% Charging capability	20%	
Number of spaces requiring charging infrastructure	687	
% requiring charging stations	25%	
Number of Chargers[5]	172	
Annual VMT Reduction All Stations (based on Charge)	15,672,188	

Estimated Benefit from Installing Electric Vehicle Charging Stations.

GHG Emissions of Gasoline vehicles	3,902	$MTCO_2e/yr$
GHG Emisssions of Electric Vehicles	545	$MTCO_2e/yr$
Net Reduction in Emissions	3,357	$MTCO_2e/yr$
Emissions/station	19.55	$MTCO_2e/yr$

The approximate 40% reduction in GHG emissions attributable to vehicles using the Project is

attributed to around 5% of the parking spaces on site. The math behind that calculation does not make sense. The City must re-evaluate the significant GHG impacts from the Project by requesting the preparation of a revised DEIR.

O6-33 Continued

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts (including an increase in the potential for residents along Alderbrook Avenue to be exposed to DPM, resulting in an increased health risk) if allowed to proceed. A revised DEIR should be prepared to address these substantial concerns.

O6-34

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling

Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995

M.S., Environmental Health Science, University of California, 1993

B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well-recognized toxicologist, air modeler, and health scientist specializing in dose reconstruction. He has 30 years of experience in tying together environmental contaminants measurements to human health impacts. Using environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling, RESRAD, GENII); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); Dr. Clark has testified in Federal and State courts on dose reconstructions for personal injury and in mass tort claims.

    Client: Law Offices of Roy L. Mason. Annapolis, Maryland
11. Case: Scott D. McClurg, et al. v. Mallinckrodt Inc. and Cotter Corporation. Lead Case No.: 4:12CV00361 AGF United States District Court Eastern District of Missouri Eastern Division.
    Client: Environmental Law Group, Birmingham, AL.
12. Louise Kowall, Donna Kopecek, and Evelyn Vehouc v, United States Steel Corporation. Count of Common Pleas of Washington County, Pennsylvania Civil Division. Case No. 2017-3355
    Client: Bonnet, Fairbourn, Friedman & Balint, PC, Phoenix, Arizona, Jacks Legal Group, PLLC, Morgantown, West Virginia, and The Calwell Law Practice, LC, Charleston, West Virginia.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client(s) – Multiple

Indoor Air Evaluations, California: Performed multiple indoor air screening evaluations and risk characterizations consistent with California Environmental Protection Agency's (Cal/EPA) Department of Toxic Substances Control (DTSC) and Regional Water Quality Control Board (RWQCB) methodologies. Characterizations included the use of DTSC's modified Johnson & Ettinger Model and USEPA models, as well as the attenuation factor model currently advocated by Cal/EPA's Office of Environmental Health and Hazard Assessment (OEHHA).

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model were used to estimate acute and chronic exposure concentrations to multiple contaminants and were be incorporated into a comprehensive risk evaluation.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

EMERGING/PERSISTENT CONTAMINANT RESEARCH/PROJECTS

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark managed the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark assisted the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client – Confidential, Los Angeles, California

Dr. Clark is performing a comprehensive review of the potential for pharmaceuticals and their by-products to impact groundwater and surface water supplies. This evaluation will include a review if available data on the history of

pharmaceutical production in the United States; the chemical characteristics of various pharmaceuticals; environmental fate and transport; uptake by xenobiotics; the potential effects of pharmaceuticals on water treatment systems; and the potential threat to public health. The results of the evaluation may be used as a briefing tool for non-public health professionals.

PUBLIC HEALTH/TOXICOLOGY

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

        - - - - - - - - - - - - - - - - - -
349
350     ** Model Options Selected:
351          * Model Uses Regulatory DEFAULT Options
352          * Model Is Setup For Calculation of Average CONCentration Values.
353          * NO GAS DEPOSITION Data Provided.
354          * NO PARTICLE DEPOSITION Data Provided.
355          * Model Uses NO DRY DEPLETION. DDPLETE  =  F
356          * Model Uses NO WET DEPLETION. WETDPLT  =  F
357          * Stack-tip Downwash.
358          * Model Accounts for ELEVated Terrain Effects.
359          * Use Calms Processing Routine.
360          * Use Missing Data Processing Routine.
361          * No Exponential Decay.
362          * Model Uses RURAL Dispersion Only.
363          * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
364          * CCVR_Sub - Meteorological data includes CCVR substitutions
365          * TEMP_Sub - Meteorological data includes TEMP substitutions
366          * Model Assumes No FLAGPOLE Receptor Heights.
367          * The User Specified a Pollutant Type of: DPM
368
369     **Model Calculates  1 Short Term Average(s) of:  24-HR
370         and Calculates ANNUAL Averages
371
372     **This Run Includes:      1 Source(s);       1 Source Group(s); and     138 Receptor(s)
373
374                    with:      0 POINT(s), including

SUBJECT: City of Santa Clarita Shadowbox Studio Project
Santa Clarita, California
Review and Comment on DEIR

Dear Mr. Franco,

Per your request, Wilson Ihrig has reviewed the information and noise impact analysis in the following documents:

City of Santa Clarita Shadowbox Studio Project
Draft Environmental Impact Report ("DEIR")
April 2023

Blackhall Studios-Santa Clarita Project
Noise and Vibration Study ("Technical Report" or "TR")
Prepared by Rincon Consultants, Inc.
July 2022

O6-35

The Proposed Project (Project) consists of developing a full-service film and television campus on a vacant 93.5-acre site and would consist of 19 sound stages, a large support building, parking structure, a catering building, and mechanical building south of Placerita Creek. The project site is located in the City of Santa Clarita, bounded by 12th Street, Arch Street, and 13th Street on the south; a railroad right-of-way (ROW) and Railroad Avenue on the west; Metropolitan Water District ROW on the east; and slopes maintained by the adjacent residential uses to the north.

This letter reports our comments on the noise analysis in the subject document. Wilson Ihrig, Acoustical Consultants, has practiced exclusively in the field of acoustics since 1966. During our 57 years of operation, we have prepared hundreds of noise studies for Environmental Impact Reports and Statements. We have one of the largest technical laboratories in the acoustical consulting industry. We also utilize industry-standard acoustical programs such as Roadway Construction Noise Model (RCNM), SoundPLAN, and CADNA. In short, we are well qualified to prepare environmental noise studies and review studies prepared by others.

Adverse Effects of Noise[1]

Although the health effects of noise are not taken as seriously in the United States as they are in other countries, they are real and, in many parts of the country, pervasive.

Noise-Induced Hearing Loss. If a person is repeatedly exposed to loud noises, he or she may experience noise-induced hearing impairment or loss. In the United States, both the Occupational Health and Safety Administration (OSHA) and the National Institute for Occupational Safety and Health (NIOSH) promote standards and regulations to protect the hearing of people exposed to high levels of industrial noise.

Speech Interference. Another common problem associated with noise is speech interference. In addition to the obvious issues that may arise from misunderstandings, speech interference also leads to problems with concentration fatigue, irritation, decreased working capacity, and automatic stress reactions. For complete speech intelligibility, the sound level of the speech should be 15 to 18 dBA higher than the background noise. Typical indoor speech levels are 45 to 50 dBA at 1 meter, so any noise above 30 dBA begins to interfere with speech intelligibility. The common reaction to higher background noise levels is to raise one's voice. If this is required persistently for long periods of time, stress reactions and irritation will likely result.

O6-36

Sleep Disturbance. Noise can disturb sleep by making it more difficult to fall asleep, by waking someone after they are asleep, or by altering their sleep stage, e.g., reducing the amount of rapid eye movement (REM) sleep. Noise exposure for people who are sleeping has also been linked to increased blood pressure, increased heart rate, increase in body movements, and other physiological effects. Not surprisingly, people whose sleep is disturbed by noise often experience secondary effects such as increased fatigue, depressed mood, and decreased work performance.

Cardiovascular and Physiological Effects. Human's bodily reactions to noise are rooted in the "fight or flight" response that evolved when many noises signaled imminent danger. These include increased blood pressure, elevated heart rate, and vasoconstriction. Prolonged exposure to acute noises can result in permanent effects such as hypertension and heart disease.

Impaired Cognitive Performance. Studies have established that noise exposure impairs people's abilities to perform complex tasks (tasks that require attention to detail or analytical processes) and it makes reading, paying attention, solving problems, and memorizing more difficult. This is why there are standards for classroom background noise levels and why offices and libraries are designed to provide quiet work environments.

[1] More information on these and other adverse effects of noise may be found in *Guidelines for Community Noise*, eds B Berglund, T Lindvall, and D Schwela, World Health Organization, Geneva, Switzerland, 1999. (https://www.who.int/docstore/peh/noise/Comnoise-1.pdf)

Potentially Significant Construction Noise Impacts Have Not Been Mitigated

The DEIR states that "because noise levels resulting from construction activities would be temporary and would comply with provisions in the City's Noise Ordinance, construction noise impacts resulting from the construction of the Project and off-site improvements would be less than significant" [DEIR page 4.11-15]. Per CEQA Guidelines, "**a project would have significant impact if it would result in generation of a substantial <u>temporary or permanent</u> increase in ambient levels**" [DEIR page 4.11-11]. Further, according to the air quality section, construction activity would take place between April 2023 and September 2025, a period of more than 2 years. The Santa Clarita Municipal code generally considers "temporary" to mean less than one year [Municipal Code Chapter 17.67].

The DEIR construction analysis predicts a 70 dBA Leq noise level[2] from three pieces of equipment at a distance of 200 feet [DEIR page 4.11-15]. The City of Santa Clarita Municipal Code Noise Ordinance limits noise to 65 dBA during daytime hours in residential zones, with corrections based on duration as well as the tonal character of the source [DEIR page 4.11-11]. For example, the code applies a minus 5 dB correction to "a steady whine, screech or hum," which may be produced by a generator or mechanical equipment. Section 11.44.080 of the ordinance limits the hours of construction work within 300 feet of any residentially zoned property, but does not exempt construction work from the noise limits set forth in section 11.44.040. Therefore the construction noise level of 70 dBA would exceed the ordinance limit of 65 dBA. **Predicted 70 dBA construction noise levels <u>do not</u> comply with provisions in the City's Noise Ordinance.** O6-37

Furthermore, the DEIR incorrectly applies an 80 dBA noise threshold for construction noise, based on FTA Transit Noise and Vibration Assessment Criteria, rather than using the City of Santa Clarita Noise Ordinance Limits it cites.

The Project should look at an ambient-based threshold in addition to the 65 dBA City Ordinance criteria in order to evaluate construction noise impacts to determine whether a substantial temporary or permanent increase in ambient levels would occur, per CEQA Guidelines above. As stated in the DEIR, "a 5-dB change is generally recognized as a clearly discernible difference" [DEIR page 4.11-14] and a 10-dB increase is judged by most people as a doubling of the sound level. Measured ambient Leq levels at the residences closest to the project boundary, to the east, were 47-49 dBA and even lower, 42-43 dBA, north of the project [DEIR Figure 4.11-2]. **Predicted 70 dBA construction noise levels are more than 20 dB above these ambient levels.** Measured levels across the railroad track and Railroad Avenue were 70 dBA [DEIR Figure 4.11-2]. However, this short-term measurement does not capture the variable nature of traffic noise along this busy road, nor does the DEIR state if the measurement includes any rail activity. Therefore, it is not possible to determine whether NM5 represents the range of ambient levels at the residences west of the project. **Nevertheless, construction noise at this location would still clearly exceed the City's Noise Ordinance limit of 65 dBA.**

The Noise Technical Report shows a sample calculation for construction noise from a grader, front end loader, and dump truck at 200 feet from a sensitive receptor [TR page 65]. The Air Quality Report in Appendix C of the DEIR shows a complete list of anticipated construction equipment for each phase of work, including unit amounts [Air Quality Report page 127**]. Individually, all of the equipment**

[2] Noise levels are one-hour average (equivalent) levels (Leq) unless otherwise noted. Leq is defined as the steady sound pressure level which, over a given period of time, has the same total energy as the actual fluctuating noise. Thus, the Leq is in fact the RMS sound level with the measure-ment duration used as the averaging time.

on this list, except for the welder, exceeds the City Noise Ordinance 65 dBA criteria at 200 feet. Based on equipment usage factors and reference Lmax levels provided by the FHWA Roadway Construction Noise Model, noise levels from all construction phases range from 64 dBA (architectural coating) to 77 dBA (grading work) at 200 feet as shown in Table 1 below. Grading work at 105 feet (closest distance to sensitive receptors per DEIR page 4.11-15) would be as high as 83 dBA. **All construction phases exceed the City Noise Ordinance and exceed ambient levels by 15 dBA or more.**

Table 1 Predicted Construction Noise Levels at 200 feet

O6-37
Continued

Operational Noise Impact Analysis Incomplete

The Project should look at an ambient-based threshold in addition to the City Ordinance criteria in order to evaluate operational noise impacts, to determine whether a substantial temporary or permanent increase in ambient levels would occur, per CEQA Guidelines above.

The DEIR states that operational noise predictions were generated by SoundPLAN using its source database for parking lot, exhaust, and HVAC sources [DEIR page 4.11-13]. Figure 4.11-3 in the DEIR shows noise contours for operational noise from HVAC and exhaust point sources and parking lot area sources [DEIR page 4.11-16]. Table 4.11-3 shows predicted operational noise levels at sensitive receptors [DEIR page 4.11-17]. **The report does not, however, include the SoundPLAN reference levels used or provide a detailed narrative of operational activities on site, including schedule.**

DEIR Figure 4.11-3 shows a concrete wall around the perimeter of the site, as described in Objective S6.2: "a 12-foot-tall security fence would be installed along the majority of the perimeter of the project site" [DEIR page 4.10-39]. A solid barrier at the perimeter could provide 10-15 dB reduction based on simple geometry, however based on architectural renderings in Figure 4.1-3, it appears the wall has holes in it, which would dramatically reduce its effectiveness to 5 dBA reduction. Based on the contours shown in Figure 4.11-3 and the receptor noise levels shown in Table 4.11-3**, it appears the SoundPLAN model could be overestimating attenuation from the perimeter wall.**

O6-38

DEIR Figure 4.11-3 shows a 50 dBA Leq contour line around the boundaries of the project site. The site plan [DEIR page 2.0-6] shows a MWD Lot for "excess truck and trailer parking / base camp" directly adjacent to the residences on Alderbrook Drive east of the site. The DEIR analysis does not address trucks idling in this lot, other auxiliary noise sources like generators, or loud speech from shoot coordination (possibly even amplified), nor does it address if the MWD lot will be active at night. Per FHWA, idling diesel trucks emit noise at 85 dBA at 50 feet, so levels at residences along Alderbrook Drive could be as high as 68 dBA with 5 dB reduction from the perimeter fence. **Noise from trucks could exceed the City Noise Ordinance if they are idling 50% of the time during the day or 5% of the time at night.**

DEIR Figure 4.11-3 shows a 45 dBA contour line around the sound stage building from rooftop mechanical equipment. The Technical Report includes cut sheets for equipment planned for the site, including sound power levels for HVAC units from Daikin [TR page 142]. The model shown in the cut sheets would produce sound pressure levels of 77 dBA at 10 feet from the unit. It does not appear these reference levels were used in the SoundPLAN model. **It is not clear whether mechanical noise from the project would comply with the City Noise Ordinance at nearby residences due to lack of documentation of the SoundPLAN model.**

Conclusions

DEIR incorrectly applies an 80 dBA noise threshold for construction noise, based on FTA Transit Noise and Vibration Assessment Criteria, rather than using the City of Santa Clarita Noise Ordinance Limits it cites. The DEIR does not consider whether the project would generate "a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project" or use the correct City Noise Ordinance criteria. Had it done so, it would have found that construction noise will cause a significant impact to the neighboring residents. O6-39

Based on the available information it is not clear whether operational noise from the project would comply with the City Noise Ordinance at nearby residences. In particular, the model with the non-solid perimeter sound wall appears to over-estimate the wall's effectiveness.

Please feel free to contact me with any questions on this information.

Very truly yours,

Relevant Experience

BART Berryessa Station Transit Noise Impact and Mitigation, San Jose, CA Assisted with noise predictions and barrier design recommendations.

Massachusetts Bay Transportation Authority (MBTA) Green Line Extension (GLX), Boston, MA Lead analyst on noise predictions and barrier design.

RTD Eagle P3 Northwest Corridor Noise and Impacts, Denver, CO Assisted with data analysis and helped prepare final technical report.

Alameda CTC, I-880 Interchange Improvements Project (Whipple Road-Industrial Southwest and Industrial Parkway West), Hayward, CA Project Manager for traffic noise study.

Alameda CTC, I-80/Ashby Avenue Interchange Improvements, Berkeley, CA Project Manager for traffic noise study.

Millennium Bulk Terminal, Longview, WA Prepared noise analysis for the project's NEPA and SEPA environmental impact statements.

Peninsula Humane Society & SPCA Haskin Hill Sanctuary, Loma Mar, CA Prepared an environmental study for a planned animal sanctuary in Loma Mar.

Analog (ArtX) Hotel, Palo Alto, CA Prepared preliminary basis of design guidelines for a new five-story boutique hotel in a residential area.

Sunnydale Block 3A & 3B Mixed-Use Residential Development, San Francisco, CA Prepared a CCR Title 24 Noise Study Report for two, mixed-use, 5-story buildings.

Columbia University Medical Center Medical and Graduate Education Building, New York, NY Conducted baseline noise survey and performed attended noise measurements during preliminary construction work.

Hudson Yards Tower C Foundations and Utilities, New York, NY Conducted a baseline noise survey prior to construction work including a combination of long-term unattended and short-term attended noise measurements.

PANYNJ Lincoln Tunnel Helix Rehabilitation, NJ Assisted in developing construction noise control and mitigation plan and implementing a remote long-term noise monitoring program at three locations.

MSK 74th Street, New York, NY Conducted baseline noise survey, assisted in developing construction noise control and mitigation plan, and implemented a long-term noise monitoring program at two locations.

NY MTA No. 7 Line Subway Extension Ventilation Facility Construction, New York, NY The project involved mining and lining of two shafts and construction of a 2-story ventilation building.

NY MTA ESA/LIRR Grand Central Terminal Fit-Out, New York, NY Prepared the Contractor's noise and vibration control plan updates for fit-out work conducted underground at the Grand Central Terminal Suburban Level.

San Francisco Planning Department, Alameda Street Wet Weather Tunnel and Folsom Area Sewer Improvement, San Francisco, CA Noise and vibration analysis for Folsom Area stormwater infrastructure improvements.

World Trade Center Vehicle Security Center, New York, NY Conducted baseline noise surveys, assisted in developing construction noise control plans, and implementing a remote long-term noise monitoring program.

50 Pine Street Condominiums, New York, NY
Project involved evaluating mechanical noise at residential dwelling units for NYC noise code

Uptown Newport, Newport Beach, CA
Evaluation of noise levels due to mechanical equipment at adjacent property.

RE: Shadowbox Studios Project

Dear Ms. Iverson,

I write to comment on potential impacts to wildlife that were analyzed in the Draft Environmental Impact Report ("DEIR") that was prepared for the Shadowbox Studios Project, which I understand would replace 93.5 acres of open space with 1,285,000 square feet of building floor space up to 55 feet tall. I also reviewed a report on biological resources prepared by Rincon (2023).

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I subsequently worked for four years as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, interactions between wildlife and human infrastructure and activities, conservation of rare and endangered species, and on the ecology of invading species. I authored numerous papers on special-status species issues. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and the Raptor Research Foundation, and I've been a part-time lecturer at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-five years, including at many proposed project sites. My CV is attached.

O6-40

SITE VISIT

On my behalf, Noriko Smallwood, who is a wildlife biologist with a Master's Degree from California State University, Los Angeles, visited the site of the proposed project at 06:35 hours on the 14th of May 2023. She surveyed from the site's perimeter, scanning for wildlife with binoculars. The sky was partly cloudy to sunny with south winds up to 5 mph and temperatures of 57–70° F. The site was covered by annual grassland in the south, coastal sage scrub in the north, and riparian vegetation along Placerita Creek toward the northern portion of site (Photos 1 – 6). Vegetation included California buckwheat, California sagebrush, coyote bush, mule fat, California yerba santa, elderberry, cottonwood, and large mature Coast live oaks and Valley oaks scattered on site. Bordering to the east and west were ornamental trees.

Photos 1 and 2. *View of project site, 14 May 2023. Photos by Noriko Smallwood.*

O6-40
Continued

Noriko detected 40 species of vertebrate wildlife (Table 1), 6 of which are special-status species. Noriko saw harvester ants and California ground squirrels (Photos 7 and 8), which are significant because these two species are keystone species. Their presence contributes substantial ecosystem services such as soil bioturbation due to their fossorial habits, and as prey for multiple additional species including special-status species, e.g., Blainville's horned lizards feed on harvester ants, and raptors feed on ground squirrels. California ground squirrels are also mutualists with burrowing owls, as the co-habitation of these two species increases productivity of each through mutual vigilance for predators and predator alarm-calling.

Noriko also saw Allen's hummingbird and California thrasher (Photos 10 and 11), both of which are special-status species. She saw bushtits and ash-throated flycatcher (Photos 12 and 13), California quail and Bewick's wren (Photos 14 and 15), Cooper's hawk (Photo 16), which is another special-status species, and mourning dove and white-breasted nuthatch (Photos 17 and 18). She also saw California scrub-jays and common ravens (Photos 19 and 20).

Photos 3 – 6. *View of the project site, 14 May 2023. Photos by Noriko Smallwood.*

O6-40
Continued

Most of the birds Noriko observed were either foraging or engaged in behaviors typically associated with breeding. The Allen's hummingbirds and Anna's hummingbirds defended their nest territories against other birds. American crows mobbed a red-tailed hawk, likely because it flew too close to their nest site. White-breasted nuthatches delivered food to their chicks in tree cavities. Not only did Noriko see 40 species of vertebrate wildlife at the project site, but she saw that they were using the site for foraging and breeding. The project site is a productive site for wildlife.

Table 1. *Species of wildlife Noriko observed during 3.52 hours of survey on 14 May 2023.*

Common name	***Species name***	**Status[1]**	**Notes**
Harvester ant	*Pogonomyrmex sp.*		
Great Basin fence lizard	*Sceloporus occidentalis longipes*		
California quail	*Callipepla californica*		Male singing in tree
Rock pigeon	*Columba livia*	Non-native	
Eurasian collared-dove	*Streptopelia decaocto*	Non-native	
Mourning dove	*Zenaida macroura*		
Anna's hummingbird	*Calypte anna*		Territorial
Allen's hummingbird	*Selasphorus sasin*	BCC	Territorial
Turkey vulture	*Cathartes aura*	BOP	Flew over site
Cooper's hawk	*Accipiter cooperii*	TWL, BOP	Flew low into tree
Red-tailed hawk	*Buteo jamaicensis*	BOP	Flew over site
Woodpecker sp.	*Picidae sp.*		Drumming just off site
Ash-throated flycatcher	*Myiarchus cinerascens*		
Cassin's kingbird	*Tyrannus vociferans*		
Black phoebe	*Sayornis nigricans*		
Say's phoebe	*Sayornis saya*		Foraging
California scrub-jay	*Aphelocoma californica*		
American crow	*Corvus brachyrhynchos*		Harassed red-tailed hawk
Common raven	*Corvus corax*		Many foraging, socializing
Northern rough-winged swallow	*Stelgidopteryx serripennis*		Foraging
Bushtit	*Psaltriparus minimus*		
Cedar waxwing	*Bombycilla cedrorum*		
White-breasted nuthatch	*Sitta carolinensis*		Food deliveries to nest cavity in pepper tree
Bewick's wren	*Thryomanes bewickii*		Pair chasing each other
California thrasher	*Toxostoma redivivum*	BCC	
Northern mockingbird	*Mimus polyglottos*		
European starling	*Sturnus vulgaris*	Non-native	Food deliveries, cottonwood
Western bluebird	*Sialia mexicana*		Pair foraging
House sparrow	*Passer domesticus*	Non-native	
House finch	*Haemorphous mexicanus*		
Lesser goldfinch	*Spinus psaltria*		
Song sparrow	*Melospiza melodia*		Just off site
California towhee	*Melozone crissalis*		

Common name	*Species name*	Status[1]	Notes
Southern California rufous-crowned sparrow	*Aimophila ruficeps canescens*	TWL	Singing from shrubs
Spotted towhee	*Pipilo maculatus*		
Coyote	*Canis latrans*		Unhealthy looking
Pocket mouse	*Perognathus sp.*		Burrows
Botta's pocket gopher	*Thomomys bottae*		Burrows
California ground squirrel	*Otospermophilus beecheyi*		Burrows and individuals
Black-tailed jackrabbit	*Lepus californicus*		Two on site
Raccoon	*Procyon lotor*		Tracks

[1] Listed as BCC = U.S. Fish and Wildlife Service Bird of Conservation Concern, TWL = Taxa to Watch List (Shuford and Gardali 2008), BOP = Birds of Prey (California Fish and Game Code 3503.5).

O6-40
Continued

Reconnaissance-level surveys, such as the survey completed by Noriko and Rincon (2023), can be useful for confirming presence of species that were detected, but they can also be useful for estimating the number of species that were not detected. One can model the pattern in species detections during a survey as a means to estimate the number of species that used the site but were undetected during the survey. To support such a modeling effort, the observer needs to record the times into the survey when each species was first detected. I do not possess data on times into the survey when the Rincon biologists detected species of wildlife, but Noriko recorded times of detection to her data. Her cumulative number of species' detections increased with increasing survey time, but eventually with diminishing returns (Figure 1). This pattern reflects the relative ease of detecting the most conspicuous species early during the survey, and the greater difficulty with detecting the rarer and more cryptic of the species.

O6-41

In the case of Noriko's survey, the pattern in the data (Figure 1) predicts that had she spent more time on site, or had she help from additional biologists, she would have detected 68 species of vertebrate wildlife on the morning of her survey, or nearly twice the number she actually detected. Her rate of cumulative species detections exceeded the upper bound of the 95% confidence interval estimated from 291 other project sites that she and I have surveyed in California (Figure 1). The pattern in the data is substantial evidence that (1) Noriko's survey sufficed only as a sampling of the wildlife community at the project site, and (2) the project site supports a richer community of vertebrate wildlife than the majority of other sites we have surveyed throughout California. The pattern in Noriko's survey data informs that a much greater survey effort is needed at the site in order to characterize the existing environmental setting with sufficient accuracy to support a sound impacts analysis.

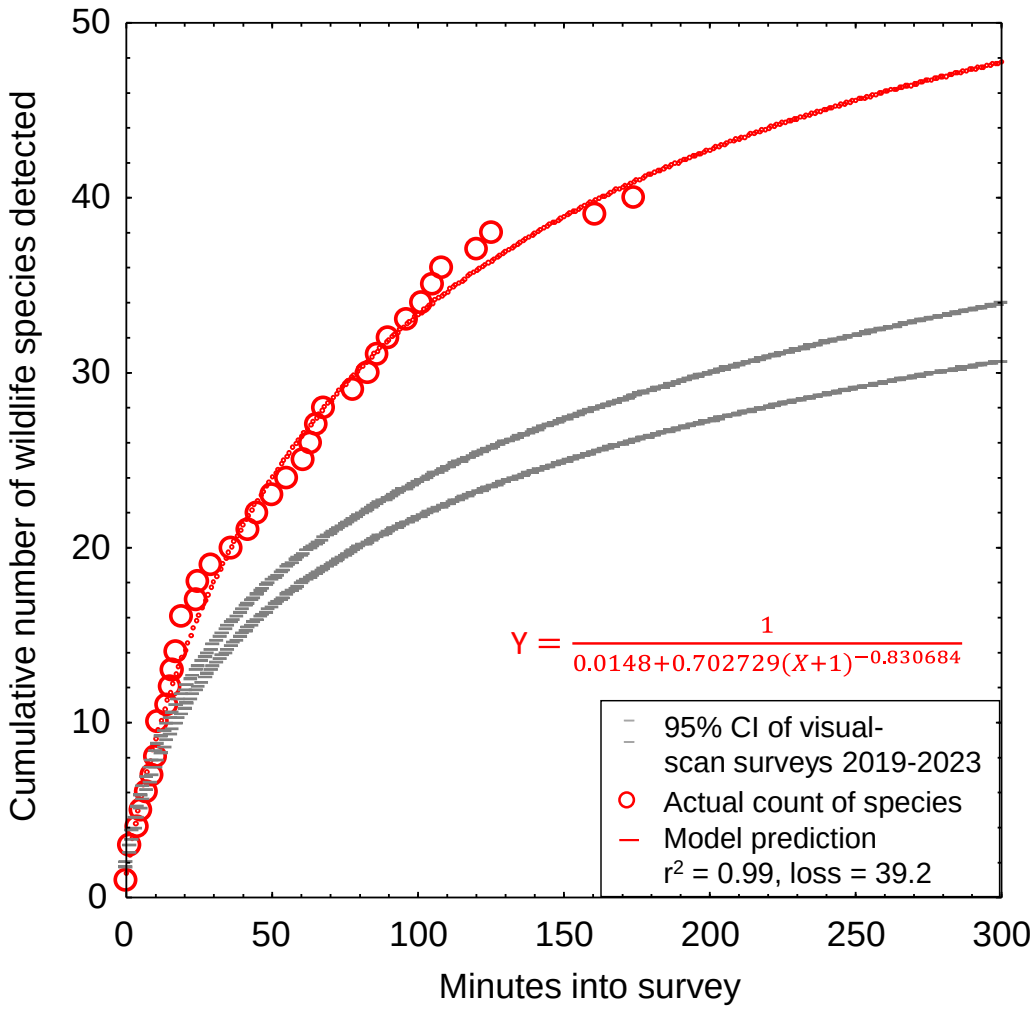

Figure 1. *Actual and predicted relationship between the number of vertebrate wildlife species detected and the elapsed survey time based on a visual-scan survey on the morning of 14 May 2023. The 95% confidence interval (CI) was based on 291 other reconnaissance-level surveys completed by Noriko Smallwood and myself at sites of proposed projects throughout California. Note that the relationship would differ if the survey was based on another method or during another season.*

The site supports more species of wildlife than Noriko could detect during her brief reconnaissance-level survey. However, although this modeling approach is useful for more realistically representing the species richness of the site at the time of a survey, it cannot represent the species richness throughout the year or across multiple years because many species are seasonal or even multi-annual in their movement patterns and in their occupancy of habitat.

By use of an analytical bridge, a modeling effort applied to a large, robust data set from a research site can predict the number of vertebrate wildlife species that likely make use of the site over the longer term. As part of my research, I completed a much larger survey effort across 167 km² of annual grasslands of the Altamont Pass Wind Resource

O6-41
Continued

Area, where from 2015 through 2019 I performed 721 1-hour visual-scan surveys, or 721 hours of surveys, at 46 stations. I used binoculars and otherwise the methods were the same as the methods Noriko and I and other consulting biologists use for surveys at proposed project sites. At each of the 46 survey stations, I tallied new species detected with each sequential survey at that station, and then related the cumulative species detected to the hours (number of surveys, as each survey lasted 1 hour) used to accumulate my counts of species detected. I used combined quadratic and simplex methods of estimation in Statistica to estimate least-squares, best-fit nonlinear models of the number of cumulative species detected regressed on hours of survey (number of surveys) at the station: $\hat{R} = \frac{1}{1/a+b\times(Hours)^c}$, where $\hat{R}$ represented cumulative species richness detected. The coefficients of determination, r^2, of the models ranged 0.88 to 1.00, with a mean of 0.97 (95% CI: 0.96, 0.98); or in other words, the models were excellent fits to the data.

I projected the predictions of each model to thousands of hours to find predicted asymptotes of wildlife species richness. The mean model-predicted asymptote of species richness was 57 after 11,857 hours of visual-scan surveys among the 46 stations of my research site. I also averaged model predictions of species richness at each incremental increase of number of surveys, i.e., number of hours (Figure 2). On average I detected 14 species over the first 3.5 hours of surveys at my research site in the Altamont Pass (3.5 hours to match the number of hours Noriko surveyed at the project site), which composed 24.6% of the predicted total number of species I would detect with a much larger survey effort at the research site. Given the example illustrated in Figure 2, the 40 species Noriko detected after her 3.5 hours of survey at the project site likely represented 24.6% of the species to be detected after many more visual-scan surveys over another year or longer. With many more repeat surveys through the year, she would likely detect $40/0.246 = 163$ species of vertebrate wildlife at the site. Assuming her ratio of special-status to non-special-status species was to hold with through the detections of all 163 predicted species, then continued surveys would eventually detect 24 special-status species of wildlife. The combined survey outcomes of Rincon's and Noriko's lend support to my predictions, as their combined survey efforts have already detected 60 species including 11 with special status.

O6-41
Continued

Again, however, my prediction of 163 species of vertebrate wildlife, including 24 special-status species of wildlife, is derived from daytime visual-scan surveys, and would not detect nocturnal mammals such as bats. The true number of species composing the wildlife community of the site must be larger. A reconnaissance-level survey should serve only as a starting point toward characterization of a site's wildlife community, but it certainly cannot alone inform of the inventory of species that use the site. Not even Rincon's (2023) focused surveys for burrowing owl and California gnatcatcher sufficiently sampled the wildlife community for the purpose of accurately characterizing the existing environmental setting. More surveys are needed.

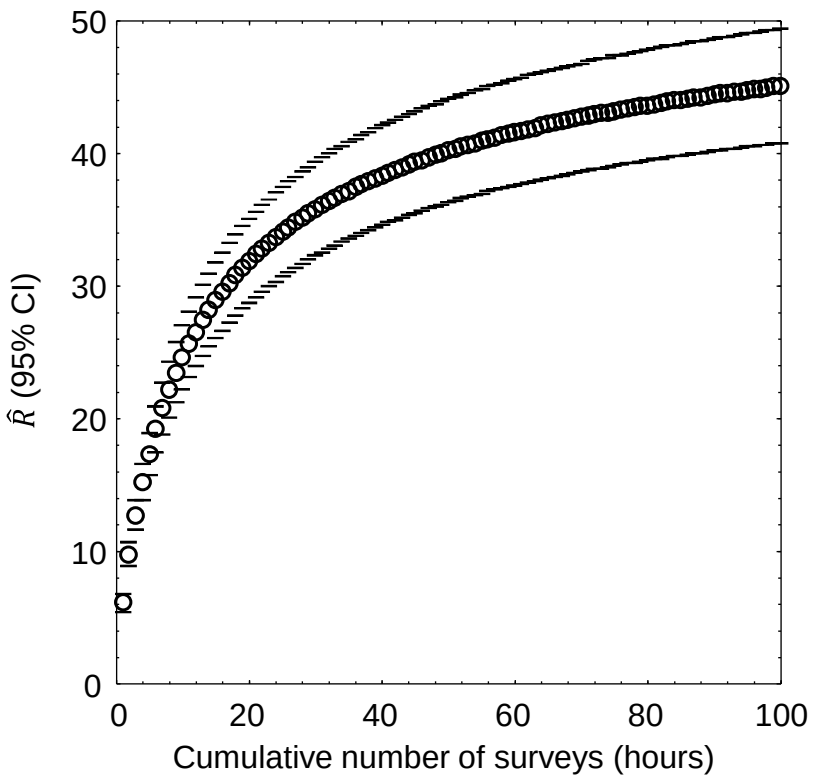

Figure 2. *Mean (95% CI) predicted wildlife species richness, $\hat{R}$, as a nonlinear function of hour-long survey increments across 46 visual-scan survey stations across the Altamont Pass Wind Resource Area, Alameda and Contra Costa Counties, 2015–2019.*

O6-41
Continued

EXISTING ENVIRNMENTAL SETTING

The first step in analysis of potential project impacts to biological resources is to accurately characterize the existing environmental setting, including the biological species that use the site, their relative abundances, how they use the site, key ecological relationships, and known and ongoing threats to those species with special status. A reasonably accurate characterization of the environmental setting can provide the basis for determining whether the site holds habitat value to wildlife, as well as a baseline against which to analyze potential project impacts. For these reasons, characterization of the environmental setting, including the project site's regional setting, is one of CEQA's essential analytical steps (§15125). Methods to achieve this first step typically include (1) surveys of the site for biological resources, and (2) reviews of literature, databases and local experts for documented occurrences of special-status species. In the case of this project, these essential steps remain incomplete and misleading.

O6-42

Environmental Setting informed by Field Surveys

To CEQA's primary objective to disclose potential environmental impacts of a proposed project, it helps for the analysis to be informed of which biological species are known to occur at the proposed project site, which special-status species are likely to occur, as well as the limitations of the survey effort directed to the site. Analysts need this information to characterize the environmental setting as a basis for opining on, or predicting, potential project impacts to biological resources.

Rincon (2023:5) reports, "All biological resources encountered on-site were recorded." I have never met a biologist who would be capable of doing this; this reporting is false and misleading. It would be more accurate to report that all biological resources encountered on site, and which were familiar to the biologists, were recorded. Many species of wildlife could have made use of the site without leaving evidence that would have been recognizable by the biologists, such as burrows, tracks, scats. As biologists usually do, the Rincon biologists would have seen these types of evidence and passed them by without recording them because they wouldn't have known which species left the evidence. The biologists would not have known the identities of many of the arthropods they encountered, and indeed they recorded none. Surely the Rincon biologists must have seen the harvester ants on site, or at least their burrows or evidence of their food-gathering, but they did not report them. The Rincon biologists recorded the occurrences of many plant species, but it is doubtful they recorded all species they encountered. The DEIR should be revised to more carefully report what was seen and understood by the biologists, and it should describe the limitations of the surveys and the reporting of survey outcomes. O6-43

Two biologists from Rincon (2023) completed a reconnaissance survey of unreported duration on 20 January 2022. Not reporting the time when the survey began and the survey's duration are critical omissions that limit the reader's interpretation of the survey outcome. Unreported and unknown to the reader is whether the 23 species of vertebrate wildlife detected on site represented an impressive number after 15 minutes of survey or a dismal number after a day-long survey. Reporting that 23 species were detected in the absence of the context of survey effort is misleading. And what concerns me about the 23 species of wildlife reportedly detected is that Noriko detected nearly twice this number of vertebrate wildlife survey in only 3.5 hours and from locations around the site's perimeter. With direct access to the site and twice the number of personnel, Rincon's biologists should have seen many more species of wildlife. O6-44

Rincon (2023) reports additional species of wildlife that were detected during focused surveys for burrowing owl and California gnatcatcher, but these additional species are reported in separate reports, and the combined number of species detected across surveys is never discussed. In fact, including an incidental detection of yellow warbler by another consulting firm, Rincon (2023) includes 46 species having been detected. Simply reporting the 23 species detected only during the reconnaissance survey is accurate, but it also misleads by neglecting to mention the other 23 species that were detected during all the surveys that were completed on the project site. In fact, the 23 species detected during the reconnaissance survey is the number of species the DEIR reports to have been detected, as if this was the total number of species detected by Rincon (it was not). Considering the additional 14 species detected by Noriko on 14 May 2023, Rincon's reconnaissance survey detected only 38% of the 60 wildlife species that have been documented on site by surveys completed by professional biologists, and only 14% of the species my model predicts would be detected on site after a year or longer of additional diurnal surveys. Rincon's survey effort is deficient and their reporting is deficient. The DEIR needs to be revised with the outcomes of more surveys and with more complete reporting, and the revised DEIR needs to report the total number of species detected and not just the 23 species detected during a single reconnaissance O6-45

survey; Another 22 species were detected during the focused surveys for burrowing owls and California gnatcatcher, and another 14 species were detected by Noriko Smallwood.

O6-45 Continued

It would also help for the DEIR to note the special-status of California thrasher, Nuttall's woodpecker and wrentit, all of which are US Fish and Wildlife Service Birds of Conservation Concern. The DEIR reports the detections of these species, but not their special status.

Rincon (2023) reports important conclusions regarding the occurrence likelihoods of special-status species, but some of these conclusions are unsupportable by the evidence Rincon cites. For example, Rincon (2023) reports, "An individual Cooper's hawk was observed perched on top of a coast live oak tree within the project site during the January 2022 reconnaissance survey…; however, a nest was not observed." The addition that a nest was not observed gives the false impression that the failure to observe a nest in January would indicate the species is not nesting on the site. The same false impression was conveyed by Rincon's (2023) observation that "A single, inactive passerine nest was observed within a coast live oak tree within the project site during the reconnaissance survey" This reporting is misleading. Whether a nest was observed in January is irrelevant to the nesting status of Cooper's hawk or any passerine species on the project site. Even had the survey been completed later during the nesting season, it would have been unlikely that the biologists performing a reconnaissance survey would have seen the nest of a Cooper's hawk. To find the location of a Cooper's hawk nest, biologists typically have to spend hours observing the behaviors of Cooper's hawks. Finding the nests of Passerines is likewise quite difficult.

O6-46

As another example, Rincon (2023) reasons that the yellow warbler seen on site in April 2022 was a migrant on its way to breeding habitat elsewhere, since no breeding habitat occurs on the project site. This conclusion is based on no breeding-season surveys completed for yellow warbler on the project site. It also reveals Rincon (2023) as attempting to have it both ways by concluding that the project site is not important to wildlife movement, but yet this special-status species relied on the site for its migration to breeding habitat. In truth, the yellow warbler seen on site might have been nesting on site. Otherwise, it was stopping over on the site on its way to breeding habitat elsewhere. Either way, the site provides important habitat value to yellow warbler, despites Rincon's (2023) reasoning that it does not.

O6-47

Detection Surveys

Reports of detection surveys are included with Rincon (2023). I reviewed these reports to assess to what degrees the surveys achieved the minimum standards of the available survey protocols. The California gnatcatcher surveys achieved most of the minimum standards of USFWS (1997), but no non-breeding season surveys were completed (Table 2). Nor is there any explanation of why non-breeding season surveys were not completed.

O6-48

The burrowing owl surveys were less compliant with the available survey protocol (CDFW 2012). The surveys and their reporting failed to meet 16 of the 34 applicable

minimum standards, and only partly achieved another 4 of the standards (Table 3). In my assessment, the reported burrowing owl surveys is unreliable, and cannot support an absence determination. I suspect the authors agree with my assessment, since the report twice suggests that burrowing owls could be found on the project site in the future. The burrowing owl surveys should be repeated, but this time with more careful attention to the CDFW (2012) survey and reporting standards. I recommend that qualified biologists perform the surveys.

O6-48
Continued

Environmental Setting informed by Desktop Review

The purpose of literature and database review and of consulting with local experts is to inform the reconnaissance survey, to augment it, and to help determine which protocol-level detection surveys should be implemented. Analysts need this information to identify which species are known to have occurred at or near the project site, and to identify which other special-status species could conceivably occur at the site due to geographic range overlap and site conditions. This step is important because the reconnaissance survey is not going to detect all of the species of wildlife that make use of the site. This step can identity those species yet to be detected at the site but which have been documented to occur nearby or whose available habitat associations are consistent with site conditions. Some special-status species can be ruled out of further analysis, but only if compelling evidence is available in support of such determinations (see below).

Rincon (2023) and the DEIR inadequately inform of a literature and database review, i.e., the desktop review. The DEIR's desktop review is incomplete by neglecting eBird and iNaturalist, which are useful species occurrence databases that are also readily available. The DEIR provides no evidence that local experts were consulted for knowledge of occurrences of special-status species in the project area. The desktop review is incomplete, and that part of it that is presented is also flawed (see below).

O6-49

By including in the species' likelihood of occurrence analysis only species whose documented occurrences within the nearest CNDDB quadrangles, Rincon (2023) and the DEIR screen out many special-status species from further consideration in their characterization of the wildlife community as a component of the baseline environmental setting. CNDDB is not designed to support absence determinations or to screen out species from characterization of a site's wildlife community. As noted by CNDDB, "*The CNDDB is a positive sighting database. It does not predict where something may be found. We map occurrences only where we have documentation that the species was found at the site. There are many areas of the state where no surveys have been conducted and therefore there is nothing on the map. That does not mean that there are no special status species present*." Rincon (2023) and the DEIR misuse CNDDB.

Table 2. *Assessment of whether surveys achieved the standards in the USFWS's recommended California gnatcatcher survey protocol.*

Standard in USFWS (1997)	Assessment of surveys performed	Was the standard met?
Permitted biologists notify the Service ≥10 days before intended surveys	The biologist was permitted, and the Service was notified	Yes
If within NCCP process, then complete 3 surveys separated by ≥7 days between 15 March and 30 June		---
If outside NCCP process, then complete 6 surveys separated by ≥7 days between 15 March and 30 June, and 9 surveys separated by ≥14 days between 1 July and 14 March	Completed 6 breeding-season surveys but none of the required 9 non-breeding-season surveys	No
Surveys shall be conducted between 06:00 and 12:00 Hours	Surveys completed within these times	Yes
Surveys shall avoid excessive heat, wind, rain, fog, or other inclement weather		Yes
Surveys are to be call-back surveys until individuals firts detected		Yes
Slowly walk survey routes covering ≤40 ha/day in the NCCP process and ≤32 ha/day otherwise		Yes
Report survey locations, names of survey personnel, methods used, ha covered by each biologist, numbers of surveys, dates, start and stop times of surveys, weather conditions at the start of each survey, and numbers of times recordings of gnatcatcher vocalizations were broadcast	Most of the attributes were reported	Yes
Report descriptions of the vegetation communities surveyed, number, age and sex of gnatcatchers detected, and provision of all data and field notes	Vegetation communities described, but no field notes provisioned	Mostly

Part of O6-48

Table 3. *Assessment of whether burrowing owl surveys achieved the standards in CDFW's (2012) recommended survey protocol. Standards are numbered to match those in CDFW (2012).*

Standard in CDFG (2012)	Assessment of surveys completed	Was the standard met?
Minimum qualifications of biologists performing surveys and impact assessments		
(1) Familiarity with the species and local ecology	Provides only the most rudimentary characterization of ecology and natural history, and cites only one compendium as source material, i.e., there's no use of the primary literature	No
(2) Experience conducting habitat assessments and breeding and non-breeding season surveys	"The surveys were conducted … by one biologist with experience and knowledge of burrowing owl life history and sign." None of this experience is described.	No
(3) Familiarity with regulatory statutes, scientific research and conservation related to burrowing owls	None described	No
(4) Experience with analyzing impacts on burrowing owls	None described	No
Habitat assessment		
(1) Conduct at least 1 visit covering entire site and offsite buffer to 150 m	Did not survey because most of the buffer was said to be inaccessible	No
(2) Prior to site visit, compile relevant biological information on site and surrounding area	No evidence this step was accomplished	No
(3) Check available sources for occurrence records	No evidence this step was accomplished other than to query CNDDB (as reported in larger report)	No
(4) Identify vegetation cover potentially supporting burrowing owls on site and vicinity	Vegetation is described in this report	Yes
(5a) Describe project and timeline of activities	Project is not described in this report	No
(5b) Regional setting map showing project location		Yes
(5c) Detailed map with project footprint, topography, landscape and potential vegetation-altering activities	No map of project footprint nor of topography	Partial
(5d) Biological setting including location, acreage, terrain, soils, geography, hydrology, land use and management history	Location and acreage are described	Partial

Part of O6-48

Standard in CDFG (2012)	Assessment of surveys completed	Was the standard met?
(5e) Analysis of relevant historical information concerning burrowing owl use or occupancy	None	No
(5f) Vegetation cover and height typical of temporal and spatial scales relevant to the assessment		Yes
(5g) Presence of burrowing owl individuals, pairs or sign	None seen	Yes
(5h) Presence of suitable burrows or burrow surrogates	Suitable burrows noted on site	Yes
Breeding season surveys		
Perform 4 surveys separated by at least 3 weeks		Yes
1 survey between 15 February and 15 April		Yes
2-3 surveys between 15 April and 15 July		Yes
1 survey following June 15		No
Walk transects spaced 7 m to 20 m apart	Transects 10 m apart	Yes
Scan entire viewable area using binoculars at start of each transect and at 100 m intervals	No mention of this step	No
Record all potential burrow locations determined by presence of owls or sign	Found none	---
Survey when temperature >20° C (68° F), winds <12 km/hr, and cloud cover <75%	Surveyed one day when it was too cool; No mention of cloud cover	Partial
Survey between dawn and 10:00 hours or within 2 hours before sunset	Surveyed from 06:00 to 09:00 hours	Yes
Identify and discuss any adverse conditions such as disease, predation, drought, high rainfall or site disturbance	No discussion.	No
Survey several years where activities will be ongoing, annual or start-and-stop to cover high nest site fidelity		---
Reporting should include:		
(1) Survey dates with start and end times and weather conditions		Yes
(2) Qualifications of surveyor(s)	None provided	No

Part of O6-48

Standard in CDFG (2012)	Assessment of surveys completed	Was the standard met?
(3) Discussion of how survey timing affected comprehensiveness and detection probability	None provided	No
(4) Description of survey methods including point count dispersal and duration	No point counts mentioned	Partial
(5) Description and justification of the area surveyed		Yes
(6) Numbers of nestlings or juveniles associated with each pair and whether adults were banded or marked		---
(7) Descriptions of behaviors of burrowing owls observed		---
(8) List of possible burrowing owl predators in the area, including any signs of predation of burrowing owls		No
(9) Detailed map showing all burrowing owl locations and potential or occupied burrows	No map of potential burrows	No
(10) Signed field forms, photos, etc.	No field forms	No
(11) Recent color photos of project site		Yes
(12) Copies of CNDDB field forms		---

Part of O6-48

CNDDB relies entirely on volunteer reporting from biologists who were allowed access to whatever properties they report from. Many properties have never been surveyed by biologists. Many properties have been surveyed, but the survey outcomes never reported to CNDDB. Many properties have been surveyed multiple times, but not all survey outcomes reported to CNDDB. Furthermore, CNDDB is interested only in the findings of special-status species, which means that species more recently assigned special status will have been reported many fewer times to CNDDB than were species assigned special status since the inception of CNDDB. The lack of many CNDDB records for species recently assigned special status had nothing to do with whether the species' geographic ranges overlapped the project site, but rather the brief time for records to have accumulated since the species were assigned special status. And because negative findings are not reported to CNDDB, CNDDB cannot provide the basis for estimating occurrence likelihoods, either.

In my assessment based on database reviews and site visits, 122 special-status species of wildlife are known to occur near enough to the site to warrant analysis of occurrence potential (Table 4). Of these 122 species, 13 were confirmed on site by Rincon's (2023) surveys or by Noriko's survey, and another 9 species were seen just off site (18% on site and just off site). Another 21 (17%) have been documented within 1.5 miles of the site ('Very close'), and another 27 (22%) within 1.5 and 4 miles ('Nearby'), and another 48 (39%) within 4 to 30 miles ('In region'). More than half (57%) of the species in Table 4 have been reportedly seen within 4 miles of the project site. The site therefore supports multiple special-status species of wildlife and carries the potential for supporting many more special-status species of wildlife based on proximity of recorded occurrences.

O6-49
Continued

Of the 122 special-status species of wildlife that appear in my Table 4, the DEIR addresses only 37 (30%) of them, determining only 4 of them to be present on the site. The DEIR determines occurrence potential to be high for 5 of the species, moderate for 2 species, low for 12 species, and none for 14 species. Of the 12 species assigned low potential, 2 have been recorded within 4 miles of the project site, 3 have been recorded within 1.5 miles, and another was recently recorded just off site. Of the 14 species assigned no potential to occur, 3 have been recorded within 1.5 and 4 miles of the project site, and 2 have been recorded within 1.5 miles of the site. Too many of the occurrence potentials assigned by Rincon (2023) to special-status species fail to comport with eBird and iNaturalist records or with Noriko's survey outcome.

Rincon (2023), i.e., the DEIR, makes flawed arguments in defense of occurrence likelihood determinations directed to the 26 species determined to have no potential or low potential. For example, Rincon (2023) too often cites lack of CNDDB records within 5 miles of the project site. Another related argument is that the CNDDB records are too old. As I pointed out earlier, lack of CNDDB records often las nothing to do with occurrence potential, because the CNDDB is a positive sightings database and relies on access to properties and volunteer reporting. Also, because CNDDB records are not based on scientific sampling or monitoring, the age of records has no bearing on whether species might still occur on site. The period of 30 years since the last CNDDB record of San Diego desert woodrat in the area has nothing to do with the present likelihood of occurrence of this species.

Table 4. *Occurrence likelihoods of special-status bird species at or near the proposed project site, according to eBird/iNaturalist records (https://eBird.org, https://www.inaturalist.org) and on-site survey findings, where 'Very close' indicates within 1.5 miles of the site, "nearby" indicates within 1.5 and 4 miles, and "in region" indicates within 4 and 30 miles, and 'in range' means the species' geographic range overlaps the site.*

[1] Listed as FT or FE = federal threatened or endangered, FC = federal candidate for listing, BCC = U.S. Fish and Wildlife Service Bird of Conservation Concern, CT or CE = California threatened or endangered, CCT or CCE = Candidate California threatened or endangered, CFP = California Fully Protected (California Fish and Game Code 3511), SSC = California Species of Special Concern (not threatened with extinction, but rare, very restricted in range, declining throughout range, peripheral portion of species' range, associated with habitat that is declining in extent), SSC1, SSC2 and SSC3 = California Bird Species of Special Concern priorities 1, 2 and 3, respectively (Shuford and Gardali 2008), WL = Taxa to Watch List (Shuford and Gardali 2008), and BOP = Birds of Prey (CFG Code 3503.5), and WBWG = Western Bat Working Group with priority rankings, of low (L), moderate (M), and high (H).

In the case of San Diego black-tailed jackrabbit, Rincon (2023) reasons that the nearest CNDDB record was 6.25 miles away in 2005. The year of the record is irrelevant unless CNDDB was informed by a suitably designed monitoring study. As for the distance, a San Diego black-tailed jackrabbit could cover 6.25 miles in about 9 minutes. The distance is rather trivial for this species.

Another flawed argument is the pigeon-holing of species into portions of the environment than they actually use as habitat, and then to assert that those pigeon-holed environments are absent from the project site. This type of argument is applied to bats.

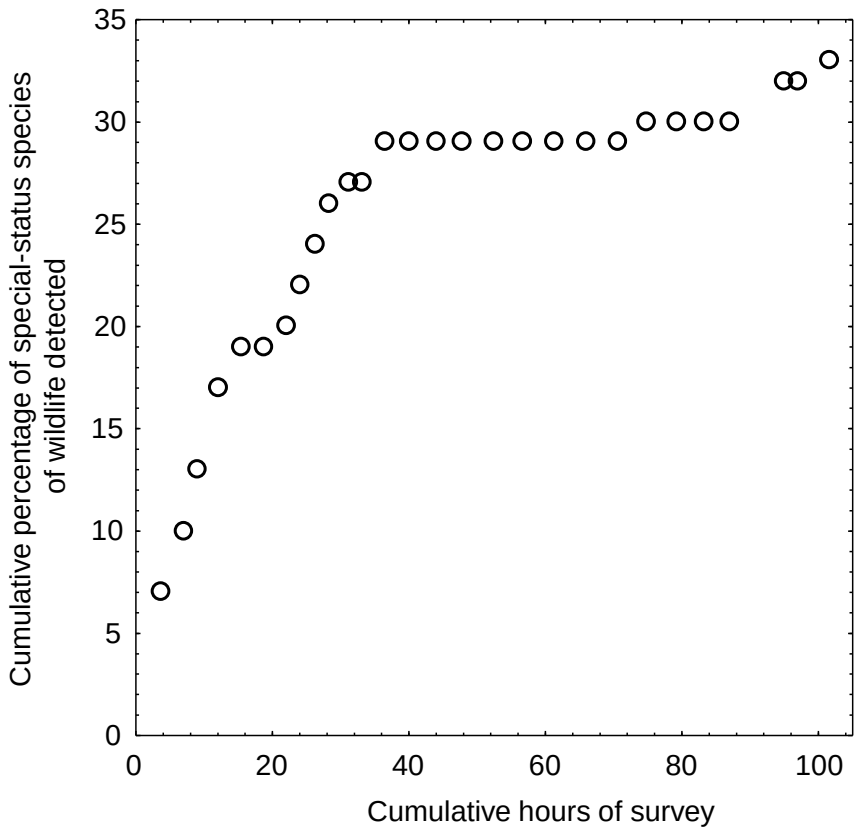
In the case of bank swallow, Rincon (2023) points out that vertical banks and cliffs are absent from the site, thereby implying, falsely, that if nest structures are absent from a site, then so is the species. If vertical banks or cliffs occur nearby, then bank swallows might very well rely on the project site for foraging in support of their nest attempts. This same type of fallacious argument is applied to California condor, prairie falcon, white-tailed kite,

In the case of American badger, Rincon (2023) defends its Low Potential determination with the argument that "no suitable burrows or diagnostic sign of the species was observed within the project site." However, I have worked with American badgers for decades, so I know from experience that badgers are expert at hiding their breeding burrows and they do not always dig into ground squirrel burrows as a hunting strategy. I have observed badgers chasing after juvenile ground squirrels. Using a thermal-imaging camera at night, I have also seen badgers walking around in areas where I saw no sign of their presence during the day. For cryptic species such as American badgers and other special-status species, the likelihood of detection during a single reconnaissance survey can be quite low (see below).

O6-49
Continued

Following up on my comment that each reconnaissance survey at a project site carries a relatively low likelihood of detection of most special-status species, I call attention to the 28 reconnaissance-level surveys I completed thus far over the last 2.5 years at a single project site in Rancho Cordova, California. During my first reconnaissance survey at this site, I detected 7 special-status species of wildlife during. Had I relied solely on that first survey to determine species' occurrences, I would have grossly under-represented the special-status species at the site (Figure 3). With additional reconnaissance surveys, I detected more special-status species, and it was not until 28 such surveys had been completed before I reached my current count of 33 special-status species of wildlife (Figure 3). It remains to be learned whether my special-status species count might increase after completion of additional surveys, but the fact is that the 27 surveys that followed my first survey increased my count by nearly 4.7-fold. My current count of special-status species is based only on reconnaissance-level surveys, so has yet to include species that might be detected by implementation of nocturnal surveys, the use of live-trapping and other methodologies, and the implementation of protocol-level detection surveys.

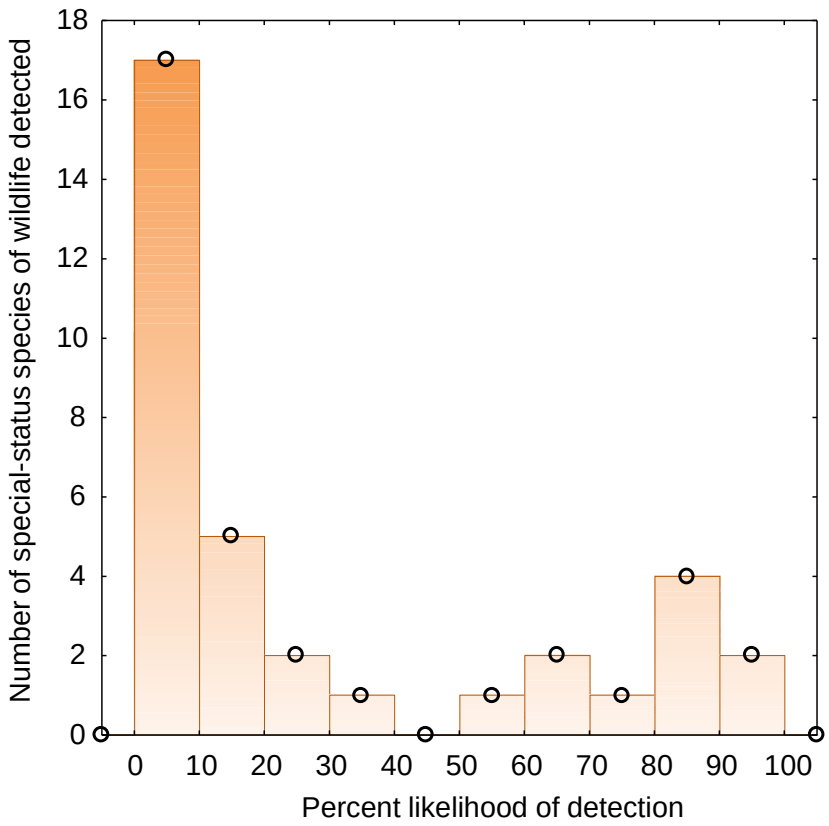
Figure 3. *Cumulative percentage of special-status species I detected with each sequential reconnaissance-level survey at a project site in Rancho Cordova, 2021-2023.*



O6-49
Continued

Only two special-status species at my Rancho Cordova site have carried 95% to 100% likelihoods of detection per reconnaissance-level survey (Figure 4), and most of the rest carried much lower likelihoods of detection. Half of the special-status species of wildlife I detected at my Rancho Cordova site carried likelihoods of detection per reconnaissance survey of only <10% (Figure 4). Assuming this distribution of species' detection likelihoods apply to the Shadowbox Studios site (there is no reason not to assume this), the 6 special-status species of wildlife detected by Rincon's (2023) biologists represent 21% of those that would be detected after another 27 reconnaissance-level surveys, then one can predict the eventual detection of 29 special-status species of wildlife. Noriko's addition of 5 special-status species after a second reconnaissance survey exceeds the rate of added species that would be predicted by my Rancho Cordova findings (see Figure 3), so her survey helps to validate my predictions summarized above.

Figure 4. *Numbers of special-status species of wildlife I detected relative to the percent likelihood of detection (number of surveys in which species was detected ÷ 28 surveys × 100%) at a project site in Rancho Cordova, California, which I surveyed 28 times over the past 2.5 years.*



O6-49
Continued

With the foregoing, I am not arguing that at least 28 reconnaissance-level surveys are needed in support of an accurate characterization of the existing environmental setting, although the data from my Rancho Cordova site support this argument. I am merely pointing out that the survey outcomes of reconnaissance-level surveys need to be interpreted carefully within the context of what should be expected of this type of survey. It is inappropriate to assign low likelihoods of occurrence to special-status species of wildlife simply because the biologist did not detect the species during a single reconnaissance survey. At my Rancho Cordova site, 26 of the special-status species not detected during my first survey were subsequently detected in later surveys. assignments of low likelihood of occurrence are supportable only after multiple reconnaissance-level surveys or more appropriately after meeting the minimum standards of the available protocol-level detection surveys that were formulated for each species. For those species for which survey guidelines are not directly available, guidelines can sometimes be borrowed from other closely-related specie or best scientific practices can be applied.

O6-50

With the foregoing, I am also pointing out that the wildlife community of the project site is richer than Rincon (2023) and the DEIR characterize it. More special-status species occur at the site than the DEIR claims. That I am correct about this was proven by Noriko's survey. Noriko detected 14 species that Rincon did not, and she detected 5 special-status species that Rincon did not. Based on my experience, additional survey effort would reveal even more special-status species, and my models based on survey outcomes at other sites predict at least 12 to 13 special-status species of vertebrate

O6-51

wildlife are yet to be found at the site through reconnaissance-level surveys alone, Detection surveys and use of other methods would very likely increase our understanding of how many special-status species and which species occur at the site. At this point, the DEIR inaccurately informs of the wildlife community at the project site.

O6-51 Continued

POTENTIAL BIOLOGICAL IMPACTS

An impacts analysis should consider whether and how a proposed project would affect members of a species, larger demographic units of the species, the whole of a species, and ecological communities. In the following I analyze three types of impacts likely to result from the project, two of which are not analyzed in the DEIR, and the other is mentioned but fallaciously speculated to be of no significance.

O6-52

According to the DEIR (p. 2.0-1), "the Project Site ... comprises an undeveloped piece of land that has been cleared of the majority of its natural vegetation." And, "the majority of the Project Site have been disturbed by past uses, are relatively flat, and are characterized by low, ruderal plants and gravel driveways." On the other hand, the DEIR also reports "16 oak trees (coast live oak and valley oak) located throughout the Project Site."

HABITAT LOSS AND HABITAT FRAGMENTATION

The DEIR fails to analyze the site's capacity to support wildlife. The project area has undergone severe habitat fragmentation, which is a process widely believed to pose the greatest threat to wildlife conservation (Smallwood 2015). The project would contribute further to habitat fragmentation in an environmental setting in which wildlife would be devastated by the loss of one of the region's last patches of naturally-covered open space. Habitat fragmentation and habitat loss have been recognized as the most likely leading causes of a documented 29% decline in overall bird abundance across North America over the last 48 years (Rosenberg et al. 2019). Habitat loss not only results in the immediate numerical decline of wildlife, but it also results in permanent loss of productive capacity. All this said, the very late stage of habitat fragmentation represented at the project site warrants concern, but the DEIR expresses no concern over the project's contribution to habitat fragmentation.

O6-53

In the case of birds, two methods exist for estimating the loss of productive capacity that would be caused by the project. One method would involve surveys to count the number of bird nests and chicks produced. Such counts would need to be made in the nesting season. No effort was directed to find and record all of the bird nests on site – an effort that would be extraordinarily difficult due to the size of the project area, the numbers of birds likely to nest there, and the skill of birds at hiding their nests. The alternative method is to estimate productive capacity based on what is known of total nest density measured elsewhere. Two study sites in grassland-wetland-woodland complexes had total bird nesting densities of 32.8 and 35.8 nests per acre (Young 1948, Yahner 1982) for an average 34.3 nests per acre. Assuming the 93.5-acre project footprint supports about 60% of the total nesting density of the above-referenced study sites, one can predict a loss of 1,924 bird nests.

The loss of 1,924 nest sites would qualify as a significant project impact to birds that has not been quantitatively addressed in the DEIR. But the impact does not end with the immediate loss of nest sites as nest substrate is removed and foraging grounds graded in preparation for impervious surfaces. The reproductive capacity of the site would be lost. The average number of fledglings per nest in Young's (1948) study was 2.9. Assuming Young's (1948) study site typifies bird productivity, the project would prevent the production of 5,580 fledglings per year. Assuming an average bird generation time of 5 years, the lost capacity of both breeders and annual fledgling production can be estimated from an equation in Smallwood (2022): {(nests/year × chicks/nest × number of years) + (2 adults/nest × nests/year) × (number of years ÷ years/generation)} ÷ (number of years) = 6,350 birds per year denied to California. The DEIR proposes no mitigation for this impact. The DEIR needs to be revised to appropriately analyze the project's impacts to wildlife caused by habitat loss and habitat fragmentation.

O6-53 Continued

WILDLIFE MOVEMENT

One of CEQA's principal concerns regarding potential project impacts is whether a proposed project would interfere with wildlife movement in the region. Based on the inaccurate assumption that disruption of wildlife movement corridors is the only means of a project to interfere with wildlife movement in the region, the DEIR (page ES-9 to ES-10) concludes that "The Project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." And at page 4.3-23, the DEIR concludes, "the Project's impacts related to interference with a migratory wildlife corridor, movement by native or migratory wildlife species, or a native wildlife nursery site would be less than significant." The DEIR's premise for its conclusions represents a false CEQA standard, and is therefore inappropriate to the analysis. The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. A site such as the proposed project site is critically important for wildlife movement because it composes an increasingly diminishing area of open space within a growing expanse of anthropogenic uses, forcing more species of volant wildlife to use the site for stopover and staging during migration, dispersal, and home range patrol (Warnock 2010, Taylor et al. 2011, Runge et al. 2014). The project would cut wildlife off from one of the last remaining stopover and staging opportunities in the project area, forcing volant wildlife to travel even farther between remaining stopover sites. This impact would be significant, and as the project is currently proposed, it would be unmitigated.

O6-54

ROAD MORTALITY

A fundamental shortfall of the DEIR is its failure to analyze or to even mention the impacts of the project's added road traffic on both special-status and non-special-status species of wildlife, including many animals that would be killed far from the project's construction footprint. To patrol home ranges, disperse from natal areas, escape predators or chase down prey, and to migrate, wildlife must cross roads traversed by cars and trucks originating from or headed toward the project site (Photo 21). In the act

O6-55

of crossing roads, which again they must do, wild animals would face injury and death from project-generated traffic (Photos 22-26). The project's impacts to wildlife would add to the traffic impacts of recently constructed residential, commercial and industrial projects in the area, and would reach as far from the project as cars and trucks travel to and from the project site.

Photo 21. *A coyote crosses a California road, 21 February 2023.*

Vehicle collisions have accounted for the deaths of many thousands of amphibians, reptiles, mammals, birds, and arthropods, and the impacts have often been found to be significant at the population level (Forman et al. 2003). Across North America, traffic impacts have taken devastating tolls on wildlife (Forman et al. 2003). In Canada, 3,562 birds were estimated killed per 100 km of road per year (Bishop and Brogan 2013), and the US estimate of avian mortality on roads is 2,200 to 8,405 deaths per 100 km per year, or 89 million to 340 million total per year (Loss et al. 2014). Local or regional impacts can be more intense than at the national level.

Photo 26. *A mourning dove killed by vehicle traffic on a California road. Photo by Noriko Smallwood, 21 June 2020.*

In a recent study of traffic-caused wildlife mortality, investigators found 1,275 carcasses of 49 species of mammals, birds, amphibians and reptiles over 15 months of searches along a 2.5-mile stretch of Vasco Road in Contra Costa County, California (Mendelsohn et al. 2009). Using carcass detection trials performed on land immediately adjacent to the traffic mortality study (Brown et al. 2016) to adjust the found fatalities for the proportion of fatalities not found due to scavenger removal and searcher error, the estimated traffic-caused fatalities was 12,187. This fatality estimate translates to a rate of 3,900 wild animals per mile per year killed. In terms comparable to the national estimates, the estimates from the Mendelsohn et al. (2009) study would translate to 243,740 animals killed per 100 km of road per year, or 29 times that of Loss et al.'s (2014) upper bound estimate and 68 times the Canadian estimate. An analysis is needed of whether increased traffic generated by the project site would similarly result in local impacts on wildlife. The vehicle miles traveled (VMT) metric is useful for predicting wildlife mortality because I was able to quantify miles traveled along the studied reach of Vasco Road during the time period of the Mendelsohn et al. (2009), hence enabling a

rate of fatalities per VMT that can be projected to other sites, assuming similar collision fatality rates.

Predicting project-generated traffic impacts to wildlife

The DEIR predicts the proposed project would result in an estimated mitigated annual VMT of 26,359,817. During the Mendelsohn et al. (2009) study, 19,500 cars traveled Vasco Road daily, so the vehicle miles that contributed to my estimate of wildlife fatalities was 19,500 cars and trucks × 2.5 miles × 365 days/year × 1.25 years = 22,242,187.5 vehicle miles per 12,187 wildlife fatalities, or 1,825 vehicle miles per fatality. This rate applied to the mitigated annual VMT would predict 14,444 wildlife fatalities. The project's toll on wildlife could be higher or lower than I predict, but even if it is 50% lower than I predict, the toll would nevertheless be 7,222 fatalities per year, which would be substantial and highly significant.

O6-55 Continued

The DEIR should be revised to include an analysis of the potential project impacts to wildlife that would be caused by project-generated automobile traffic. Mitigation measures to improve wildlife safety along roads are available and are feasible, and they need exploration for their suitability with the proposed project.

BIRD-WINDOW COLLISIONS

The project would multiple building up to 55 feet in height. One of these buildings – the Office Building – would present extensive glass windows to birds attempting to use an essential portion of their habitat – that portion of the gaseous atmosphere that is referred to as the aerosphere (Davy et al. 2017, Diehl et al. 2017). The aerosphere is where birds and bats and other volant animals with wings migrate, disperse, forage, perform courtship and where some of them mate. Birds are some of the many types of animals that evolved wings as a morphological adaptation to thrive by moving through the medium of the aerosphere. The aerosphere is habitat. Indeed, an entire discipline of ecology has emerged to study this essential aspect of habitat – the discipline of aeroecology (Kunz et al. 2008). Many special-status species of birds have been recorded at or near the aerosphere of the project site, and Noriko saw many birds using the aerosphere while she surveyed the site. Bird-window collision mortality is a potentially significant impact that warrants analysis.

O6-56

Window collisions are often characterized as either the second or third largest source or human-caused bird mortality. The numbers behind these characterizations are often attributed to Klem's (1990) and Dunn's (1993) estimates of about 100 million to 1 billion bird fatalities in the USA, or more recently by Loss et al.'s (2014) estimate of 365-988 million bird fatalities in the USA or Calvert et al.'s (2013) and Machtans et al.'s (2013) estimates of 22.4 million and 25 million bird fatalities in Canada, respectively. The proposed project would impose windows in the airspace normally used by birds.

Glass-façades of buildings intercept and kill many birds, but these façades are differentially hazardous to birds based on spatial extent, contiguity, orientation, and other factors. At Washington State University, Johnson and Hudson (1976) found 266

bird fatalities of 41 species within 73 months of monitoring of a three-story glass walkway (no fatality adjustments attempted). Prior to marking the windows to warn birds of the collision hazard, the collision rate was 84.7 per year. At that rate, and not attempting to adjust the fatality estimate for the proportion of fatalities not found, 4,574 birds were likely killed over the 54 years since the start of their study, and that's at a relatively small building façade. Accounting for the proportion of fatalities not found, the number of birds killed by this walkway over the last 54 years would have been about 14,270. And this is just for one 3-story, glass-sided walkway between two college campus buildings.

Klem's (1990) estimate was based on speculation that 1 to 10 birds are killed per building per year, and this speculated range was extended to the number of buildings estimated by the US Census Bureau in 1986. Klem's speculation was supported by fatality monitoring at only two houses, one in Illinois and the other in New York. Also, the basis of his fatality rate extension has changed greatly since 1986. Whereas his estimate served the need to alert the public of the possible magnitude of the bird-window collision issue, it was highly uncertain at the time and undoubtedly outdated more than three decades hence. Indeed, by 2010 Klem (2010) characterized the upper end of his estimated range – 1 billion bird fatalities – as conservative. Furthermore, the estimate lumped species together as if all birds are the same and the loss of all birds to windows has the same level of impact.

O6-56
Continued

By the time Loss et al. (2014) performed their effort to estimate annual USA bird-window fatalities, many more fatality monitoring studies had been reported or were underway. Loss et al. (2014) incorporated many more fatality rates based on scientific monitoring, and they were more careful about which fatality rates to include. However, they included estimates based on fatality monitoring by homeowners, which in one study were found to detect only 38% of the available window fatalities (Bracey et al. 2016). Loss et al. (2014) excluded all fatality records lacking a dead bird in hand, such as injured birds or feather or blood spots on windows. Loss et al.'s (2014) fatality metric was the number of fatalities per building (where in this context a building can include a house, low-rise, or high-rise structure), but they assumed that this metric was based on window collisions. Because most of the bird-window collision studies were limited to migration seasons, Loss et al. (2014) developed an admittedly assumption-laden correction factor for making annual estimates. Also, only 2 of the studies included adjustments for carcass persistence and searcher detection error, and it was unclear how and to what degree fatality rates were adjusted for these factors. Although Loss et al. (2014) attempted to account for some biases as well as for large sources of uncertainty mostly resulting from an opportunistic rather than systematic sampling data source, their estimated annual fatality rate across the USA was highly uncertain and vulnerable to multiple biases, most of which would have resulted in fatality estimates biased low.

In my review of bird-window collision monitoring, I found that the search radius around homes and buildings was very narrow, usually 2 meters. Based on my experience with bird collisions in other contexts, I would expect that a large portion of bird-window collision victims would end up farther than 2 m from the windows, especially when the windows are higher up on tall buildings. In my experience, searcher detection rates tend

to be low for small birds deposited on ground with vegetation cover or woodchips or other types of organic matter. Also, vertebrate scavengers entrain on anthropogenic sources of mortality and quickly remove many of the carcasses, thereby preventing the fatality searcher from detecting these fatalities. Adjusting fatality rates for these factors – search radius bias, searcher detection error, and carcass persistence rates – would greatly increase nationwide estimates of bird-window collision fatalities.

Buildings can intercept many nocturnal migrants as well as birds flying in daylight. As mentioned above, Johnson and Hudson (1976) found 266 bird fatalities of 41 species within 73 months of monitoring of a four-story glass walkway at Washington State University (no adjustments attempted for undetected fatalities). Somerlot (2003) found 21 bird fatalities among 13 buildings on a university campus within only 61 days. Monitoring twice per week, Hager at al. (2008) found 215 bird fatalities of 48 species, or 55 birds/building/year, and at another site they found 142 bird fatalities of 37 species for 24 birds/building/year. Gelb and Delacretaz (2009) recorded 5,400 bird fatalities under buildings in New York City, based on a decade of monitoring only during migration periods, and some of the high-rises were associated with hundreds of fatalities each. Klem et al. (2009) monitored 73 building façades in New York City during 114 days of two migratory periods, tallying 549 collision victims, nearly 5 birds per day. Borden et al. (2010) surveyed a 1.8 km route 3 times per week during 12-month period and found 271 bird fatalities of 50 species. Parkins et al. (2015) found 35 bird fatalities of 16 species within only 45 days of monitoring under 4 building façades. From 24 days of survey over a 48-day span, Porter and Huang (2015) found 47 fatalities under 8 buildings on a university campus. Sabo et al. (2016) found 27 bird fatalities over 61 days of searches under 31 windows. In San Francisco, Kahle et al. (2016) found 355 collision victims within 1,762 days under a 5-story building. Ocampo-Peñuela et al. (2016) searched the perimeters of 6 buildings on a university campus, finding 86 fatalities after 63 days of surveys. One of these buildings produced 61 of the 86 fatalities, and another building with collision-deterrent glass caused only 2 of the fatalities, thereby indicating a wide range in impacts likely influenced by various factors. There is ample evidence available to support my prediction that the proposed project would result in many collision fatalities of birds.

O6-56
Continued

Project Impact Prediction

I reviewed and processed results of bird collision monitoring at 213 buildings and façades for which bird collisions per m^2 of glass per year could be calculated and averaged (Johnson and Hudson 1976, O'Connell 2001, Somerlot 2003, Hager et al. 2008, Borden et al. 2010, Hager et al. 2013, Porter and Huang 2015, Parkins et al. 2015, Kahle et al. 2016, Ocampo-Peñuela et al. 2016, Sabo et al. 2016, Barton et al. 2017, Gomez-Moreno et al. 2018, Schneider et al. 2018, Loss et al. 2019, Brown et al. 2020, City of Portland Bureau of Environmental Services and Portland Audubon 2020, Riding et al. 2020). These study results averaged 0.073 bird deaths per m^2 of glass per year (95% CI: 0.042-0.102). This average and its 95% confidence interval provide a robust basis for predicting fatality rates at a proposed new project.

The DEIR prepared for the Shadowbox Studios Project does not disclose the extent of glass windows on the proposed new buildings, but I was able to estimate the extent of windows by measuring the schematic depictions of them in the DEIR. I paid particular attention to the extent of windows on the Office Building, because these would be extensive. I estimate the Office Building would include 1,639 m^2 of window space. Applying the mean fatality rate (above) to my estimate of 1,639 m^2 of glass on the facades of the Office Building, I predict annual bird deaths of 120 (95% CI: 71–168).

O6-56 Continued

Because Noriko saw many birds fly across the site, I recommend exploration of alternative window layouts or alternative types of glass to minimize bird-window collisions. This can be done by comparing rates of bird flights across those portions of the aerosphere that would correspond with building locations. These rates should be measured in a program of visual-scan surveys at intervals spaced throughout a year.

CUMULATIVE IMPACTS

The cumulative effects analysis is flawed in several ways. First, at page 4.3-25, the DEIR states, "Due to the site-specific nature of biological conditions …, impacts to biological resources are typically assessed on a project-by-project basis rather than on a cumulative basis." CEQA requires a cumulative effects analysis of every project that comes under CEQA review.

Second, the DEIR acknowledges that the project would contribute to cumulative impacts because "there would be less habitat available for protected species." The DEIR then explains, "as with the Project, related projects and other future development projects would be subject to established regulations pertaining to the protection of biological resources, including those set forth in the CWA, FESA, and CESA, as well as site-specific biological resource assessments that would identify potential effects related to the existing biological conditions for that site. With adherence to applicable regulations and any site-specific recommendations set forth in a site-specific biological resource assessment, the Project and related projects would not result in significant cumulative impacts related to biological resources. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant." However, there are two flaws with this explanation. The first flaw is that this explanation implies that cumulative impacts are really just residual impacts of incomplete mitigation of project-level impacts. If that was CEQA's standard, then cumulative effects analysis would be merely an analysis of mitigation efficacy. But the DEIR's implied standard is not the standard of analysis of cumulative effects. Individually mitigated projects do not negate the significance of cumulative. If they did, then CEQA would not require a cumulative effects analysis.

O6-57

The second flaw of the DEIR's explanation is that, as far as I can determine, the City has no regional monitoring program of wildlife, plants or other biological resources to assess the efficacy of the mitigation measures that have been implemented at other projects. That is, there is no monitoring for cumulative effects nor for mitigation efficacy at the regional level. Therefore, there is no basis to trust the City's explanation over why the DEIR lacks any real cumulative effects analysis.

The third flaw of the DEIR's explanation is that the proposed project along with other projects in the region would be subject to existing regulations, the implication being that cumulative impacts would therefore be prevented. According to CEQA Guideline 15064(h)(3), "When relying on a plan, regulation or program, the lead agency should explain how implementing the particular requirements in the plan, regulation or program ensure that the project's incremental contribution to the cumulative effect is not cumulatively considerable." The DEIR provides no explanation of how the project's compliance with regulations would ensure the project's contributions to cumulative impacts to biological resources would be satisfactorily mitigated.

O6-57 Continued

To summarize, the DEIR effectively provides no cumulative effects analysis. CEQA requires a cumulative effects analysis. The DEIR needs to be revised, and it needs to include an appropriate, serious analysis of cumulative impacts.

MITIGATION MEASURES

MM-BIO-1: *The Project shall implement … best management practices during construction, of which 10 are listed.*

The DEIR's best management practices should be implemented as proposed, but it needs to be understood that implementation of these practices would not reduce impacts to less-than-significant levels. The project would destroy the productive capacity of the birds that breed on the project site, and it would destroy the productive capacities of every special-status species that makes use of the site. The proposed best management practices would not prevent further habitat fragmentation and its effects on wildlife. The best management practices would not minimize or reduce impacts to wildlife caused by project-generated traffic and by collisions with expansive windows on the Office Building, nor would they lessen the project's interference with wildlife movement in the region.

O6-58

MM-BIO-2: *A qualified biological monitor familiar with special-status species with potential to occur on the Project Site shall be present during initial ground disturbance or vegetation removal activities. The biological monitor shall have the authority to temporarily stop work if one or more individuals of these special-status species are observed; the monitor shall then relocate these individuals to suitable undisturbed habitat, outside the areas directly and indirectly affected by ground disturbance activities.*

I concur that a biological monitor should be present during construction, and I concur with the authority the DEIR proposes to confer upon the monitor. However, it needs to be understood that the presence of a biological monitor would not reduce impacts to less-than-significant levels. The project would destroy the productive capacity of the birds that breed on the project site, and it would destroy the productive capacities of every special-status species that makes use of the site. The proposed biological monitor would not prevent further habitat fragmentation and its effects on wildlife. A biological monitor would not minimize or reduce impacts to wildlife caused by project-generated

traffic and by collisions with expansive windows on the Office Building, nor would the monitor lessen the project's interference with wildlife movement in the region.

Due to the size of the project site, and should the project go forward, I recommend that two biologists be assigned to monitor construction. I also recommend that preparation of a report be required to summarize all of the events that transpired involving wildlife. These events would include all instances where and when construction needed to be halted to protect wildlife, and all discoveries of wildlife that needed to be rescued or of wildlife injuries or fatalities. This report should be shared with the public.

MM-BIO-3: *Construction activities should occur outside of the bird breeding season (generally February 1 to August 31) to the extent practicable. If construction must occur within the bird breeding season, then no more than three days prior to initiation of ground disturbance and/or vegetation removal, a nesting bird preconstruction survey shall be conducted by a qualified biologist within the disturbance footprint plus a 100-foot buffer (500 feet for raptors), where feasible. …*

The avian breeding season recognized by the California Department of Fish and Wildlife is now 1 February through 15 September. The DEIR should be revised accordingly.

I concur that preconstruction surveys for nesting birds should be implemented. However, having performed nest surveys for many bird species, I can attest to the difficulty of finding nest sites. Birds are highly skilled at hiding their nests, because except for a few species, those that do not would fail in their nest attempts due to predation. Loggerhead shrikes and burrowing owls, as examples, make efforts to fool human observers into thinking the birds' nests are located where they are not. Locating nest sites of these species and most others requires multiple surveys over long time periods to note behavior patterns that can lead the observer to nest sites. This is why the breeding-season survey protocols require multiple surveys spaced through much of the breeding season, such as for burrowing owls (CDFW 2012) and California gnatcatchers (USFWS 1997). None of the survey protocols for breeding birds recommend surveys to be completed within 3 days, and this is because the notion that such a briefly conducted survey would detect more than a small fraction of nest sites is fantasy.

O6-58
Continued

Preconstruction surveys should be performed for nesting birds, but not without first having completed detection surveys to inform both an EIR and the preconstruction surveys of the locations of nesting birds. Preconstruction surveys are only intended as last-minute, one-time salvage and rescue operations targeting readily detectable nests or individuals before they are crushed under heavy construction machinery. Because most special-status species are rare and cryptic, and because most bird species are expert at hiding their nests lest they get predated, most of their nests will not be detected by preconstruction surveys without prior support of detection surveys. For one thing, bird species vary in the timing of their nesting. For example, at a project site that I have been searching for nest attempts over the last several months, some bird species have already turned-out fledglings and some species are re-nesting, whereas other species are just now initiating nesting behaviors. Locating all of the nests on site would require more effort than is committed during preconstruction surveys.

Regardless of whether construction timing avoids the nesting season or preconstruction surveys are completed, this measure would not reduce impacts to less-than-significant levels because the project would destroy the productive capacity of the birds that breed on the project site. Neither would the preconstruction surveys do anything to thwart or diminish the impacts of further habitat fragmentation.

Should the project go forward, I recommend that it be required of the preconstruction survey biologists prepare a report of the methods and outcomes of preconstruction surveys. The report should be made available to the public.

MM-BIO-4: *Impacts to sensitive vegetation communities shall be avoided to the greatest extent feasible. Compensatory mitigation for impacts to big sagebrush scrub and scale broom scrub communities, such as on-site restoration, off-site restoration, or purchase of credits through an approved Mitigation Bank or through applicant sponsored mitigation (e.g., on-site restoration), to reduce impacts to sensitive vegetation communities shall be accomplished at a minimum ratio of 1:1; however, the final ratio shall be determined and approved by the … CDFW … At a minimum, the Restoration Plan shall include the following:*

- *A description of the purpose and goals of the restoration*
- *Identification of success criteria and performance standards*
- *Methods of site preparation*
- *Irrigation plan and schedule*
- *Best management practices*
- *Maintenance and monitoring program*
- *Adaptive management strategies*
- *Key stakeholders and responsible parties*
- *Funding*
- *Contingencies*

O6-58
Continued

The California Native Plant Society (CNPS 1998) advocates only for mitigation involving avoidance of impacts. To avoid impacts, CNPS recommends pre-project planning and design, reconfiguring an existing project, or adopting the no-project alternative, in addition to site protection such as fencing and transfer of development rights in easements or fee title.

The CNPS also recommends the mitigation exchange ratio should exceed 1:1 for most species, thereby accounting for an inevitable net loss of individuals and habitat area. Where needed, off-site compensation areas should be enhanced by reducing impacts caused by on-going activities such as over-grazing by livestock or dumping of hazardous materials or trash.

I recommend that a security deposit of ≥150% of the estimated cost of the restoration be committed prior to construction. The security deposit should be large enough to cover

the cost of additional compensatory mitigation should some portion of, or all of, the restoration fails.

MM-BIO-5 *Compensatory mitigation for temporary and permanent impacts to land subject to the jurisdiction of the … CDFW, U.S. Army Corps of Engineers (USACE), and/or Regional Water Quality Control Board (RWQCB), such as purchase of credits through an approved Mitigation Bank or through applicant sponsored mitigation (e.g., on-site restoration), shall be accomplished at a minimum ratio of 1:1*; …

O6-58
Continued

Again, I recommend that a security deposit of ≥150% of the estimated cost of any restoration be committed prior to construction. The security deposit should be large enough to cover the cost of additional compensatory mitigation should some portion of, or all of, the restoration fails.

RECOMMENDED MEASURES

Protocol-level Detection Surveys in Support of Mitigation: If the project goes forward, protocol-level detection surveys that achieve minimum standards of the available guidelines need to be completed for multiple species including burrowing owl and California gnatcatcher, and a suite of special-status species of bats. These surveys are needed to (1) support negative findings of species when appropriate, (2) inform preconstruction surveys to improve their efficacy, (3) estimate project impacts, and (4) inform compensatory mitigation and other forms of mitigation. Detection survey protocols and guidelines are available from resource agencies. Otherwise, professional standards can be learned from the scientific literature and species' experts.

Pest Control: The project should commit to no use of rodenticides and avicides. It should commit to no placement of poison bait stations outside the building.

O6-59

Guidelines on Building Design to Minimize Bird-Window Collisions: If the project goes forward, it should at a minimum adhere to available Bird-Safe Guidelines, such as those prepared by American Bird Conservancy and New York and San Francisco. The American Bird Conservancy (ABC) produced an excellent set of guidelines recommending actions to: (1) Minimize use of glass; (2) Placing glass behind some type of screening (grilles, shutters, exterior shades); (3) Using glass with inherent properties to reduce collisions, such as patterns, window films, decals or tape; and (4) Turning off lights during migration seasons (Sheppard and Phillips 2015). The City of San Francisco (San Francisco Planning Department 2011) also has a set of building design guidelines, based on the excellent guidelines produced by the New York City Audubon Society (Orff et al. 2007). The ABC document and both the New York and San Francisco documents provide excellent alerting of potential bird-collision hazards as well as many visual examples. The San Francisco Planning Department's (2011) building design guidelines are more comprehensive than those of New York City, but they could have gone further. For example, the San Francisco guidelines probably should have also covered scientific monitoring of impacts as well as compensatory mitigation for impacts that could not be avoided, minimized or reduced.

New research results inform of the efficacy of marking windows. Whereas Klem (1990) found no deterrent effect from decals on windows, Johnson and Hudson (1976) reported a fatality reduction of about 69% after placing decals on windows. In an experiment of opportunity, Ocampo-Peñuela et al. (2016) found only 2 of 86 fatalities at one of 6 buildings – the only building with windows treated with a bird deterrent film. At the building with fritted glass, bird collisions were 82% lower than at other buildings with untreated windows. Kahle et al. (2016) added external window shades to some windowed façades to reduce fatalities 82% and 95%. Brown et al. (2020) reported an 84% lower collision probability among fritted glass windows and windows treated with ORNILUX R UV. City of Portland Bureau of Environmental Services and Portland Audubon (2020) reduced bird collision fatalities 94% by affixing marked Solyx window film to existing glass panels of Portland's Columbia Building. Many external and internal glass markers have been tested experimentally, some showing no effect and some showing strong deterrent effects (Klem 1989, 1990, 2009, 2011; Klem and Saenger 2013; Rössler et al. 2015).

Monitoring and the use of compensatory mitigation should be incorporated at any new building project because the measures recommended in the available guidelines remain of uncertain efficacy, and even if these measures are effective, they will not reduce collision fatalities to zero. The only way to assess mitigation efficacy and to quantify post-construction fatalities is to monitor the project for fatalities.

O6-59
Continued

Road Mortality: Compensatory mitigation is needed for the increased wildlife mortality that would be caused by bird-window collisions and the project-generated road traffic in the region. I suggest that this mitigation can be directed toward funding research to identify fatality patterns and effective impact reduction measures such as reduced speed limits and wildlife under-crossings or overcrossings of particularly dangerous road segments. Compensatory mitigation can also be provided in the form of donations to wildlife rehabilitation facilities (see below).

Fund Wildlife Rehabilitation Facilities: Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Many animals would likely be injured by free-ranging house cats and by collisions with windows and automobiles.

Landscaping: If the project goes forward, California native plant landscaping (i.e., chaparral, grassland, and locally appropriate scrub plants) should be considered to be used as opposed to landscaping with lawn and exotic shrubs. Native plants offer more structure, cover, food resources, and nesting substrate for wildlife than landscaping with lawn. Native plant landscaping has been shown to increase the abundance of arthropods which act as importance sources of food for wildlife and are crucial for pollination and plant reproduction (Narango et al. 2017, Adams et al. 2020, Smallwood and Wood 2022.). Further, many endangered and threated insects require native host plants for reproduction and migration, e.g., monarch butterfly. Around the world, landscaping with native plants over exotic plants increases the abundance and diversity of birds, and is particularly valuable to native birds (Lerman and Warren 2011, Burghardt et al. 2008,

Berthon et al. 2021, Smallwood and Wood 2022). Landscaping with native plants is a way to maintain or to bring back some of the natural habitat and lessen the footprint of urbanization by acting as interconnected patches of habitat for wildlife (Goddard et al. 2009, Tallamy 2020). Lastly, not only does native plant landscaping benefit wildlife, it requires less water and maintenance than traditional landscaping with lawn and hedges.

Born May 3, 1963 in Sacramento, California. Married, father of two.

Ecologist

Expertise

- Finding solutions to controversial problems related to wildlife interactions with human industry, infrastructure, and activities;
- Wildlife monitoring and field study using GPS, thermal imaging, behavior surveys;
- Using systems analysis and experimental design principles to identify meaningful ecological patterns that inform management decisions.

Education

Ph.D. Ecology, University of California, Davis. September 1990.
M.S. Ecology, University of California, Davis. June 1987.
B.S. Anthropology, University of California, Davis. June 1985.
Corcoran High School, Corcoran, California. June 1981.

Experience

- 480 professional publications, including:
- 83 peer reviewed publications
- 24 in non-reviewed proceedings
- 371 reports, declarations, posters and book reviews
- 8 in mass media outlets
- 87 public presentations of research results

Editing for scientific journals: Guest Editor, *Wildlife Society Bulletin*, 2012-2013, of invited papers representing international views on the impacts of wind energy on wildlife and how to mitigate the impacts. Associate Editor, *Journal of Wildlife Management*, March 2004 to 30 June 2007. Editorial Board Member, *Environmental Management*, 10/1999 to 8/2004. Associate Editor, *Biological Conservation*, 9/1994 to 9/1995.

Member, Alameda County Scientific Review Committee (SRC), August 2006 to April 2011. The five-member committee investigated causes of bird and bat collisions in the Altamont Pass Wind Resource Area, and recommended mitigation and monitoring measures. The SRC

reviewed the science underlying the Alameda County Avian Protection Program, and advised the County on how to reduce wildlife fatalities.

Consulting Ecologist, 2004-2007, California Energy Commission (CEC). Provided consulting services as needed to the CEC on renewable energy impacts, monitoring and research, and produced several reports. Also collaborated with Lawrence-Livermore National Lab on research to understand and reduce wind turbine impacts on wildlife.

Consulting Ecologist, 1999-2013, U.S. Navy. Performed endangered species surveys, hazardous waste site monitoring, and habitat restoration for the endangered San Joaquin kangaroo rat, California tiger salamander, California red-legged frog, California clapper rail, western burrowing owl, salt marsh harvest mouse, and other species at Naval Air Station Lemoore; Naval Weapons Station, Seal Beach, Detachment Concord; Naval Security Group Activity, Skaggs Island; National Radio Transmitter Facility, Dixon; and, Naval Outlying Landing Field Imperial Beach.

Part-time Lecturer, 1998-2005, California State University, Sacramento. Instructed Mammalogy, Behavioral Ecology, and Ornithology Lab, Contemporary Environmental Issues, Natural Resources Conservation.

Senior Ecologist, 1999-2005, BioResource Consultants. Designed and implemented research and monitoring studies related to avian fatalities at wind turbines, avian electrocutions on electric distribution poles across California, and avian fatalities at transmission lines.

Chairman, Conservation Affairs Committee, The Wildlife Society--Western Section, 1999-2001. Prepared position statements and led efforts directed toward conservation issues, including travel to Washington, D.C. to lobby Congress for more wildlife conservation funding.

Systems Ecologist, 1995-2000, Institute for Sustainable Development. Headed ISD's program on integrated resources management. Developed indicators of ecological integrity for large areas, using remotely sensed data, local community involvement and GIS.

Associate, 1997-1998, Department of Agronomy and Range Science, University of California, Davis. Worked with Shu Geng and Mingua Zhang on several studies related to wildlife interactions with agriculture and patterns of fertilizer and pesticide residues in groundwater across a large landscape.

Lead Scientist, 1996-1999, National Endangered Species Network. Informed academic scientists and environmental activists about emerging issues regarding the Endangered Species Act and other environmental laws. Testified at public hearings on endangered species issues.

Ecologist, 1997-1998, Western Foundation of Vertebrate Zoology. Conducted field research to determine the impact of past mercury mining on the status of California red-legged frogs in Santa Clara County, California.

Senior Systems Ecologist, 1994-1995, EIP Associates, Sacramento, California. Provided consulting services in environmental planning, and quantitative assessment of land units for their

conservation and restoration opportunities basedon ecological resource requirements of 29 special-status species. Developed ecological indicators for prioritizing areas within Yolo County to receive mitigation funds for habitat easements and restoration.

Post-Graduate Researcher, 1990-1994, Department of Agronomy and Range Science, *U.C. Davis*. Under Dr. Shu Geng's mentorship, studied landscape and management effects on temporal and spatial patterns of abundance among pocket gophers and species of Falconiformes and Carnivora in the Sacramento Valley. Managed and analyzed a data base of energy use in California agriculture. Assisted with landscape (GIS) study of groundwater contamination across Tulare County, California.

Work experience in graduate school: Co-taught Conservation Biology with Dr. Christine Schonewald, 1991 & 1993, UC Davis Graduate Group in Ecology; Reader for Dr. Richard Coss's course on Psychobiology in 1990, UC Davis Department of Psychology; Research Assistant to Dr. Walter E. Howard, 1988-1990, UC Davis Department of Wildlife and Fisheries Biology, testing durable baits for pocket gopher management in forest clearcuts; Research Assistant to Dr. Terrell P. Salmon, 1987-1988, UC Wildlife Extension, Department of Wildlife and Fisheries Biology, developing empirical models of mammal and bird invasions in North America, and a rating system for priority research and control of exotic species based on economic, environmental and human health hazards in California. Student Assistant to Dr. E. Lee Fitzhugh, 1985-1987, UC Cooperative Extension, Department of Wildlife and Fisheries Biology, developing and implementing statewide mountain lion track count for long-term monitoring.

Fulbright Research Fellow, Indonesia, 1988. Tested use of new sampling methods for numerical monitoring of Sumatran tiger and six other species of endemic felids, and evaluated methods used by other researchers.

Projects

Repowering wind energy projects through careful siting of new wind turbines using map-based collision hazard models to minimize impacts to volant wildlife. Funded by wind companies (principally NextEra Renewable Energy, Inc.), California Energy Commission and East Bay Regional Park District, I have collaborated with a GIS analyst and managed a crew of five field biologists performing golden eagle behavior surveys and nocturnal surveys on bats and owls. The goal is to quantify flight patterns for development of predictive models to more carefully site new wind turbines in repowering projects. Focused behavior surveys began May 2012 and continue. Collision hazard models have been prepared for seven wind projects, three of which were built. Planning for additional repowering projects is underway.

Test avian safety of new mixer-ejector wind turbine (MEWT). Designed and implemented a before-after, control-impact experimental design to test the avian safety of a new, shrouded wind turbine developed by Ogin Inc. (formerly known as FloDesign Wind Turbine Corporation). Supported by a $718,000 grant from the California Energy Commission's Public Interest Energy Research program and a 20% match share contribution from Ogin, I managed a crew of seven field biologists who performed periodic fatality searches and behavior surveys, carcass detection trials, nocturnal behavior surveys using a thermal camera, and spatial analyses with the collaboration of a GIS

analyst. Field work began 1 April 2012 and ended 30 March 2015 without Ogin installing its MEWTs, but we still achieved multiple important scientific advances.

Reduce avian mortality due to wind turbines at Altamont Pass. Studied wildlife impacts caused by 5,400 wind turbines at the world's most notorious wind resource area. Studied how impacts are perceived by monitoring and how they are affected by terrain, wind patterns, food resources, range management practices, wind turbine operations, seasonal patterns, population cycles, infrastructure management such as electric distribution, animal behavior and social interactions.

Reduce avian mortality on electric distribution poles. Directed research toward reducing bird electrocutions on electric distribution poles, 2000-2007. Oversaw 5 founds of fatality searches at 10,000 poles from Orange County to Glenn County, California, and produced two large reports.

Cook *et al*. v. Rockwell International *et al*., No. 90-K-181 (D. Colorado). Provided expert testimony on the role of burrowing animals in affecting the fate of buried and surface-deposited radioactive and hazardous chemical wastes at the Rocky Flats Plant, Colorado. Provided expert reports based on four site visits and an extensive document review of burrowing animals. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals. I testified in federal court in November 2005, and my clients were subsequently awarded a $553,000,000 judgment by a jury. After appeals the award was increased to two billion dollars.

Hanford Nuclear Reservation Litigation. Provided expert testimony on the role of burrowing animals in affecting the fate of buried radioactive wastes at the Hanford Nuclear Reservation, Washington. Provided three expert reports based on three site visits and extensive document review. Predicted and verified a certain population density of pocket gophers on buried waste structures, as well as incidence of radionuclide contamination in body tissue. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals.

Expert testimony and declarations on proposed residential and commercial developments, gas-fired power plants, wind, solar and geothermal projects, water transfers and water transfer delivery systems, endangered species recovery plans, Habitat Conservation Plans and Natural Communities Conservation Programs. Testified before multiple government agencies, Tribunals, Boards of Supervisors and City Councils, and participated with press conferences and depositions. Prepared expert witness reports and court declarations, which are summarized under Reports (below).

Protocol-level surveys for special-status species. Used California Department of Fish and Wildlife and US Fish and Wildlife Service protocols to search for California red-legged frog, California tiger salamander, arroyo southwestern toad, blunt-nosed leopard lizard, western pond turtle, giant kangaroo rat, San Joaquin kangaroo rat, San Joaquin kit fox, western burrowing owl, Swainson's hawk, Valley elderberry longhorn beetle and other special-status species.

Conservation of San Joaquin kangaroo rat. Performed research to identify factors responsible for the decline of this endangered species at Lemoore Naval Air Station, 2000-2013, and implemented habitat enhancements designed to reverse the trend and expand the population.

Impact of West Nile Virus on yellow-billed magpies. Funded by Sacramento-Yolo Mosquito and Vector Control District, 2005-2008, compared survey results pre- and post-West Nile Virus epidemic for multiple bird species in the Sacramento Valley, particularly on yellow-billed magpie and American crow due to susceptibility to WNV.

Workshops on HCPs. Assisted Dr. Michael Morrison with organizing and conducting a 2-day workshop on Habitat Conservation Plans, sponsored by Southern California Edison, and another 1-day workshop sponsored by PG&E. These Workshops were attended by academics, attorneys, and consultants with HCP experience. We guest-edited a Proceedings published in Environmental Management.

Mapping of biological resources along Highways 101, 46 and 41. Used GPS and GIS to delineate vegetation complexes and locations of special-status species along 26 miles of highway in San Luis Obispo County, 14 miles of highway and roadway in Monterey County, and in a large area north of Fresno, including within reclaimed gravel mining pits.

GPS mapping and monitoring at restoration sites and at Caltrans mitigation sites. Monitored the success of elderberry shrubs at one location, the success of willows at another location, and the response of wildlife to the succession of vegetation at both sites. Also used GPS to monitor the response of fossorial animals to yellow star-thistle eradication and natural grassland restoration efforts at Bear Valley in Colusa County and at the decommissioned Mather Air Force Base in Sacramento County.

Mercury effects on Red-legged Frog. Assisted Dr. Michael Morrison and US Fish and Wildlife Service in assessing the possible impacts of historical mercury mining on the federally listed California red-legged frog in Santa Clara County. Also measured habitat variables in streams.

Opposition to proposed No Surprises rule. Wrote a white paper and summary letter explaining scientific grounds for opposing the incidental take permit (ITP) rules providing ITP applicants and holders with general assurances they will be free of compliance with the Endangered Species Act once they adhere to the terms of a "properly functioning HCP." Submitted 188 signatures of scientists and environmental professionals concerned about No Surprises rule US Fish and Wildlife Service, National Marine Fisheries Service, all US Senators.

Natomas Basin Habitat Conservation Plan alternative. Designed narrow channel marsh to increase the likelihood of survival and recovery in the wild of giant garter snake, Swainson's hawk and Valley Elderberry Longhorn Beetle. The design included replication and interspersion of treatments for experimental testing of critical habitat elements. I provided a report to Northern Territories, Inc.

Assessments of agricultural production system and environmental technology transfer to China. Twice visited China and interviewed scientists, industrialists, agriculturalists, and the Directors of the Chinese Environmental Protection Agency and the Department of Agriculture to assess the need and possible pathways for environmental clean-up technologies and trade opportunities between the US and China.

Yolo County Habitat Conservation Plan. Conducted landscape ecology study of Yolo County to spatially prioritize allocation of mitigation efforts to improve ecosystem functionality within the

County from the perspective of 29 special-status species of wildlife and plants. Used a hierarchically structured indicators approach to apply principles of landscape and ecosystem ecology, conservation biology, and local values in rating land units. Derived GIS maps to help guide the conservation area design, and then developed implementation strategies.

Mountain lion track count. Developed and conducted a carnivore monitoring program throughout California since 1985. Species counted include mountain lion, bobcat, black bear, coyote, red and gray fox, raccoon, striped skunk, badger, and black-tailed deer. Vegetation and land use are also monitored. Track survey transect was established on dusty, dirt roads within randomly selected quadrats.

Sumatran tiger and other felids. Upon award of Fulbright Research Fellowship, I designed and initiated track counts for seven species of wild cats in Sumatra, including Sumatran tiger, fishing cat, and golden cat. Spent four months on Sumatra and Java in 1988, and learned Bahasa Indonesia, the official Indonesian language.

Wildlife in agriculture. Beginning as post-graduate research, I studied pocket gophers and other wildlife in 40 alfalfa fields throughout the Sacramento Valley, and I surveyed for wildlife along a 200 mile road transect since 1989 with a hiatus of 1996-2004. The data are analyzed using GIS and methods from landscape ecology, and the results published and presented orally to farming groups in California and elsewhere. I also conducted the first study of wildlife in cover crops used on vineyards and orchards.

Agricultural energy use and Tulare County groundwater study. Developed and analyzed a data base of energy use in California agriculture, and collaborated on a landscape (GIS) study of groundwater contamination across Tulare County, California.

Pocket gopher damage in forest clear-cuts. Developed gopher sampling methods and tested various poison baits and baiting regimes in the largest-ever field study of pocket gopher management in forest plantations, involving 68 research plots in 55 clear-cuts among 6 National Forests in northern California.

Risk assessment of exotic species in North America. Developed empirical models of mammal and bird species invasions in North America, as well as a rating system for assigning priority research and control to exotic species in California, based on economic, environmental, and human health hazards.

Reports to Clients

Smallwood, K. S. 2018. Addendum to Comparison of Wind Turbine Collision Hazard Model Performance: One-year Post-construction Assessment of Golden Eagle Fatalities at Golden Hills. Report to Audubon Society, NextEra Energy, and the California Attorney General.

Smallwood, K. S., and L. Neher. 2018. Siting wind turbines to minimize raptor collisions at Rooney Ranch and Sand Hill Repowering Project, Altamont Pass Wind Resource Area. Report to S-Power, Salt Lake City, Utah.

Smallwood, K. S. 2017. Summary of a burrowing owl conservation workshop. Report to Santa Clara Valley Habitat Agency, Morgan Hill, California.

Smallwood, K. S., and L. Neher. 2017. Comparison of wind turbine collision hazard model performance prepared for repowering projects in the Altamont Pass Wind Resources Area. Report to NextEra Energy Resources, Inc., Office of the California Attorney General, Audubon Society, East Bay Regional Park District.

Smallwood, K. S., and L. Neher. 2016. Siting wind turbines to minimize raptor collisions at Summit Winds Repowering Project, Altamont Pass Wind Resource Area. Report to Salka, Inc., Washington, D.C.

Smallwood, K. S., L. Neher, and D. A. Bell. 2017. Mitigating golden eagle impacts from repowering Altamont Pass Wind Resource Area and expanding Los Vaqueros Reservoir. Report to East Contra Costa County Habitat Conservation Plan Conservancy and Contra Costa Water District.

Smallwood, K. S. 2016. Report of Altamont Pass research as Vasco Winds mitigation. Report to NextEra Energy Resources, Inc., Office of the California Attorney General, Audubon Society, East Bay Regional Park District.

Smallwood, K. S., and L. Neher. 2016. Siting Wind Turbines to Minimize Raptor collisions at Sand Hill Repowering Project, Altamont Pass Wind Resource Area. Report to Ogin, Inc., Waltham, Massachusetts.

Smallwood, K. S., and L. Neher. 2015a. Siting wind turbines to minimize raptor collisions at Golden Hills Repowering Project, Altamont Pass Wind Resource Area. Report to NextEra Energy Resources, Livermore, California.

Smallwood, K. S., and L. Neher. 2015b. Siting wind turbines to minimize raptor collisions at Golden Hills North Repowering Project, Altamont Pass Wind Resource Area. Report to NextEra Energy Resources, Livermore, California.

Smallwood, K. S., and L. Neher. 2015c. Siting wind turbines to minimize raptor collisions at the Patterson Pass Repowering Project, Altamont Pass Wind Resource Area. Report to EDF Renewable Energy, Oakland, California.

Smallwood, K. S., and L. Neher. 2014. Early assessment of wind turbine layout in Summit Wind Project. Report to Altamont Winds LLC, Tracy, California.

Smallwood, K. S. 2015. Review of avian use survey report for the Longboat Solar Project. Report to EDF Renewable Energy, Oakland, California.

Smallwood, K. S. 2014. Information needed for solar project impacts assessment and mitigation planning. Report to Panorama Environmental, Inc., San Francisco, California.

Smallwood, K. S. 2014. Monitoring fossorial mammals in Vasco Caves Regional Preserve, California: Report of Progress for the period 2006-2014. Report to East Bay Regional Park District, Oakland, California.

Smallwood, K. S. 2013. First-year estimates of bird and bat fatality rates at old wind turbines, Forebay areas of Altamont Pass Wind Resource Area. Report to FloDesign in support of EIR.

Smallwood, K. S. and W. Pearson. 2013. Neotropical bird monitoring of burrowing owls (*Athene cunicularia*), Naval Air Station Lemoore, California. Tierra Data, Inc. report to Naval Air Station Lemoore.

Smallwood, K. S. 2013. Winter surveys for San Joaquin kangaroo rat (*Dipodomys nitratoides*) and

burrowing owls (*Athene cunicularia*) within Air Operations at Naval Air Station, Lemoore. Report to Tierra Data, Inc. and Naval Air Station Lemoore.

Smallwood, K. S. and M. L. Morrison. 2013. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) conservation research in Resource Management Area 5, Lemoore Naval Air Station: 2012 Progress Report (Inclusive of work during 2000-2012). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California.

Smallwood, K. S. 2012. Fatality rate estimates at the Vantage Wind Energy Project, year one. Report to Ventus Environmental, Portland, Oregon.

Smallwood, K. S. and L. Neher. 2012. Siting wind turbines to minimize raptor collisions at North Sky River. Report to NextEra Energy Resources, LLC.

Smallwood, K. S. 2011. Monitoring Fossorial Mammals in Vasco Caves Regional Preserve, California: Report of Progress for the Period 2006-2011. Report to East Bay Regional Park District.

Smallwood, K. S. and M. L. Morrison. 2011. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) Conservation Research in Resource Management Area 5, Lemoore Naval Air Station: 2011 Progress Report (Inclusive of work during 2000-2011). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California.

Smallwood, K. S. 2011. Draft study design for testing collision risk of FloDesign Wind Turbine in Patterson Pass, Santa Clara, and Former AES Seawest Wind Projects in the Altamont Pass Wind Resource Area (APWRA). Report to FloDesign, Inc.

Smallwood, K. S. 2011. Comments on Marbled Murrelet collision model for the Radar Ridge Wind Resource Area. Report to EcoStat, Inc., and ultimately to US Fish and Wildlife Service.

Smallwood, K. S. 2011. Avian fatality rates at Buena Vista Wind Energy Project, 2008-2011. Report to Pattern Energy.

Smallwood, K. S. and L. Neher. 2011. Siting repowered wind turbines to minimize raptor collisions at Tres Vaqueros, Contra Costa County, California. Report to Pattern Energy.

Smallwood, K. S. and M. L. Morrison. 2011. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) Conservation Research in Resource Management Area 5, Lemoore Naval Air Station: 2010 Progress Report (Inclusive of work during 2000-2010). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California.

Smallwood, K. S. 2010. Wind Energy Development and avian issues in the Altamont Pass, California. Report to Black & Veatch.

Smallwood, K. S. and L. Neher. 2010. Siting repowered wind turbines to minimize raptor collisions at the Tres Vaqueros Wind Project, Contra Costa County, California. Report to the East Bay Regional Park District, Oakland, California.

Smallwood, K. S. and L. Neher. 2010. Siting repowered wind turbines to minimize raptor collisions at Vasco Winds. Report to NextEra Energy Resources, LLC, Livermore, California.

Smallwood, K. S. 2010. Baseline avian and bat fatality rates at the Tres Vaqueros Wind Project, Contra Costa County, California. Report to the East Bay Regional Park District, Oakland, California.

Smallwood, K. S. and M. L. Morrison. 2010. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) Conservation Research in Resource Management Area 5, Lemoore Naval Air Station: 2009 Progress Report (Inclusive of work during 2000-2009). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California. 86 pp.

Fitzhugh, E.L., K.S. Smallwood, and R. Gross. 1985. Mountain lion track count, Marin County, 1985. Report on file at Wildlife Extension, University of California, Davis.

Comments on Environmental Documents

I was retained or commissioned to comment on environmental planning and review documents, including:

- The Villages of Lakeview EIR (2017; 28 pp);
- Notes on Proposed Study Options for Trail Impacts on Northern Spotted Owl (2017; 4 pp);
- San Gorgonio Crossings EIR (2017; 22 pp);
- Replies to responses on Jupiter Project IS and MND (2017; 12 pp);
- MacArthur Transit Village Project Modified 2016 CEQA Analysis (2017; 12 pp);
- Central SoMa Plan DEIR (2017; 14 pp);
- Colony Commerce Center Specific Plan DEIR (2016; 16 pp);
- Fairway Trails Improvements MND (2016; 13 pp);
- Review of Avian-Solar Science Plan (2016; 28 pp);
- Replies to responses on Initial Study for Pyramid Asphalt (2016; 5 pp);
- Initial Study for Pyramid Asphalt (2016; 4 pp);
- Agua Mansa Distribution Warehouse Project Initial Study (2016; 14 pp);
- Santa Anita Warehouse IS and MND (2016; 12 pp);
- CapRock Distribution Center III DEIR (2016: 12 pp);
- Orange Show Logistics Center Initial Study and MND (2016; 9 pp);
- City of Palmdale Oasis Medical Village Project IS and MND (2016; 7 pp);
- Comments on proposed rule for incidental eagle take (2016, 49 pp);
- Grapevine Specific and Community Plan FEIR (2016; 25 pp);
- Grapevine Specific and Community Plan DEIR (2016; 15 pp);
- Clinton County Zoning Ordinance for Wind Turbine siting (2016);
- Hallmark at Shenandoah Warehouse Project Initial Study (2016; 6 pp);
- Tri-City Industrial Complex Initial Study (2016; 5 pp);
- Hidden Canyon Industrial Park Plot Plan 16-PP-02 (2016; 12 pp);
- Kimball Business Park DEIR (2016; 10 pp);
- Jupiter Project IS and MND (2016; 9 pp);
- Revised Draft Giant Garter Snake Recovery Plan of 2015 (2016, 18 pp);
- Palo Verde Mesa Solar Project Draft Environmental Impact Report (2016; 27 pp);

- Reply Witness Statement on Fairview Wind Project, Ontario, Canada (2016; 14 pp);
- Fairview Wind Project, Ontario, Canada (2016; 41 pp);
- Supplementary Reply Witness Statement Amherst Island Wind Farm, Ontario (2015, 38 pp);
- Witness Statement on Amherst Island Wind Farm, Ontario (2015, 31 pp);
- Second Reply Witness Statement on White Pines Wind Farm, Ontario (2015, 6 pp);
- Reply Witness Statement on White Pines Wind Farm, Ontario (2015, 10 pp);
- Witness Statement on White Pines Wind Farm, Ontario (2015, 9 pp);
- Proposed Section 24 Specific Plan Agua Caliente Band of Cahuilla Indians DEIS (2015, 9 pp);
- Replies to comments 24 Specific Plan Agua Caliente Band of Cahuilla Indians FEIS (2015, 6 pp);
- Willow Springs Solar Photovoltaic Project DEIR (2015; 28 pp);
- Sierra Lakes Commerce Center Project DEIR (2015, 9 pp);
- Columbia Business Center MND (2015; 8 pp);
- West Valley Logistics Center Specific Plan DEIR (2015, 10 pp);
- World Logistic Center Specific Plan FEIR (2015, 12 pp);
- Bay Delta Conservation Plan EIR/EIS (2014, 21 pp);
- Addison Wind Energy Project DEIR (2014, 32 pp);
- Response to Comments on the Addison Wind Energy Project DEIR (2014, 15 pp);
- Addison and Rising Tree Wind Energy Project FEIR (2014, 12 pp);
- Alta East Wind Energy Project FEIS (2013, 23 pp);
- Blythe Solar Power Project Staff Assessment, California Energy Commission (2013, 16 pp);
- Clearwater and Yakima Solar Projects DEIR (2013, 9 pp);
- Cuyama Solar Project DEIR (2014, 19 pp);
- Draft Desert Renewable Energy Conservation Plan (DRECP) EIR/EIS (2015, 49 pp);
- Kingbird Solar Photovoltaic Project EIR (2013, 19 pp);
- Lucerne Valley Solar Project Initial Study & Mitigated Negative Declaration (2013, 12 pp);
- Palen Solar Electric Generating System Final Staff Assessment of California Energy Commission, (2014, 20 pp);
- Rebuttal testimony on Palen Solar Energy Generating System (2014, 9 pp);
- Rising Tree Wind Energy Project DEIR (2014, 32 pp);
- Response to Comments on the Rising Tree Wind Energy Project DEIR (2014, 15 pp);
- Soitec Solar Development Project Draft PEIR (2014, 18 pp);
- Comment on the Biological Opinion (08ESMF-00-2012-F-0387) of Oakland Zoo expansion on Alameda whipsnake and California red-legged frog (2014; 3 pp);
- West Antelope Solar Energy Project Initial Study and Negative Declaration (2013, 18 pp);
- Willow Springs Solar Photovoltaic Project DEIR (2015, 28 pp);
- Alameda Creek Bridge Replacement Project DEIR (2015, 10 pp);
- Declaration on Tule Wind project FEIR/FEIS (2013; 24 pp);
- Sunlight Partners LANDPRO Solar Project Mitigated Negative Declaration (2013; 11 pp);
- Declaration in opposition to BLM fracking (2013; 5 pp);
- Rosamond Solar Project Addendum EIR (2013; 13 pp);
- Pioneer Green Solar Project EIR (2013; 13 pp);
- Reply to Staff Responses to Comments on Soccer Center Solar Project Mitigated Negative

Declaration (2013; 6 pp);
- Soccer Center Solar Project Mitigated Negative Declaration (2013; 10 pp);
- Plainview Solar Works Mitigated Negative Declaration (2013; 10 pp);

- Pacific Lumber Co. (Headwaters) Habitat Conservation Plan and Environmental Impact Report (1998: 28 pp);
- Final Environmental Impact Report/Statement for Issuance of Take authorization for listed

species within the MSCP planning area in San Diego County, California (Fed. Reg. 62 (60): 14938, San Diego Multi-Species Conservation Program) (1997: 10 pp);

- Permit (PRT-823773) Amendment for the Natomas Basin Habitat Conservation Plan, Sacramento, CA (Fed. Reg. 63 (101): 29020-29021) (1998);
- Draft Recovery Plan for the Giant Garter Snake (*Thamnophis gigas*). (Fed. Reg. 64(176): 49497-49498) (1999: 8 pp);
- Review of the Draft Recovery Plan for the Arroyo Southwestern Toad (*Bufo microscaphus californicus*) (1998);
- Ballona West Bluffs Project Environmental Impact Report (1999: oral presentation);
- California Board of Forestry's proposed amended Forest Practices Rules (1999);
- Negative Declaration for the Sunset Skyranch Airport Use Permit (1999);
- Calpine and Bechtel Corporations' Biological Resources Implementation and Monitoring Program (BRMIMP) for the Metcalf Energy Center (2000: 10 pp);
- California Energy Commission's Final Staff Assessment of the proposed Metcalf Energy Center (2000);
- US Fish and Wildlife Service Section 7 consultation with the California Energy Commission regarding Calpine and Bechtel Corporations' Metcalf Energy Center (2000: 4 pp);
- California Energy Commission's Preliminary Staff Assessment of the proposed Metcalf Energy Center (2000: 11 pp);
- Site-specific management plans for the Natomas Basin Conservancy's mitigation lands, prepared by Wildlands, Inc. (2000: 7 pp);
- Affidavit of K. Shawn Smallwood in Spirit of the Sage Council, et al. (Plaintiffs) vs. Bruce Babbitt, Secretary, U.S. Department of the Interior, et al. (Defendants), Injuries caused by the No Surprises policy and final rule which codifies that policy (1999: 9 pp).

Comments on other Environmental Review Documents:

- Proposed Regulation for California Fish and Game Code Section 3503.5 (2015: 12 pp);
- Statement of Overriding Considerations related to extending Altamont Winds, Inc.'s Conditional Use Permit PLN2014-00028 (2015; 8 pp);
- Draft Program Level EIR for Covell Village (2005; 19 pp);
- Bureau of Land Management Wind Energy Programmatic EIS Scoping document (2003: 7 pp.);
- NEPA Environmental Analysis for Biosafety Level 4 National Biocontainment Laboratory (NBL) at UC Davis (2003: 7 pp);
- Notice of Preparation of UC Merced Community and Area Plan EIR, on behalf of The Wildlife Society—Western Section (2001: 8 pp.);
- Preliminary Draft Yolo County Habitat Conservation Plan (2001; 2 letters totaling 35 pp.);
- Merced County General Plan Revision, notice of Negative Declaration (2001: 2 pp.);
- Notice of Preparation of Campus Parkway EIR/EIS (2001: 7 pp.);
- Draft Recovery Plan for the bighorn sheep in the Peninsular Range (*Ovis candensis*) (2000);
- Draft Recovery Plan for the California Red-legged Frog (*Rana aurora draytonii*), on behalf of The Wildlife Society—Western Section (2000: 10 pp.);
- Sierra Nevada Forest Plan Amendment Draft Environmental Impact Statement, on behalf of The Wildlife Society—Western Section (2000: 7 pp.);

- State Water Project Supplemental Water Purchase Program, Draft Program EIR (1997);
- Davis General Plan Update EIR (2000);
- Turn of the Century EIR (1999: 10 pp);
- Proposed termination of Critical Habitat Designation under the Endangered Species Act (Fed. Reg. 64(113): 31871-31874) (1999);
- NOA Draft Addendum to the Final Handbook for Habitat Conservation Planning and Incidental Take Permitting Process, termed the HCP 5-Point Policy Plan (Fed. Reg. 64(45): 11485 - 11490) (1999; 2 pp + attachments);
- Covell Center Project EIR and EIR Supplement (1997).

Position Statements I prepared the following position statements for the Western Section of The Wildlife Society, and one for nearly 200 scientists:

- Recommended that the California Department of Fish and Game prioritize the extermination of the introduced southern water snake in northern California. The Wildlife Society--Western Section (2001);
- Recommended that The Wildlife Society—Western Section appoint or recommend members of the independent scientific review panel for the UC Merced environmental review process (2001);
- Opposed the siting of the University of California's 10th campus on a sensitive vernal pool/grassland complex east of Merced. The Wildlife Society--Western Section (2000);
- Opposed the legalization of ferret ownership in California. The Wildlife Society--Western Section (2000);
- Opposed the Proposed "No Surprises," "Safe Harbor," and "Candidate Conservation Agreement" rules, including permit-shield protection provisions (Fed. Reg. Vol. 62, No. 103, pp. 29091-29098 and No. 113, pp. 32189-32194). This statement was signed by 188 scientists and went to the responsible federal agencies, as well as to the U.S. Senate and House of Representatives.

Smith, T. R. and K. S. Smallwood. 2000. Effects of study area size, location, season, and allometry on reported *Sorex* shrew densities. Annual Meeting of the Western Section of The Wildlife Society.

Presentations at Professional Meetings and Seminars

Repowering the Altamont Pass. Altamont Symposium, The Wildlife Society – Western Section, 5 February 2017.

Developing methods to reduce bird mortality in the Altamont Pass Wind Resource Area, 1999-2007. Altamont Symposium, The Wildlife Society – Western Section, 5 February 2017.

Conservation and recovery of burrowing owls in Santa Clara Valley. Santa Clara Valley Habitat Agency, Newark, California, 3 February 2017.

Mitigation of Raptor Fatalities in the Altamont Pass Wind Resource Area. Raptor Research Foundation Meeting, Sacramento, California, 6 November 2015.

From burrows to behavior: Research and management for burrowing owls in a diverse landscape. California Burrowing Owl Consortium meeting, 24 October 2015, San Jose, California.

The Challenges of repowering. Keynote presentation at Conference on Wind Energy and Wildlife Impacts, Berlin, Germany, 10 March 2015.

Research Highlights Altamont Pass 2011-2015. Scientific Review Committee, Oakland, California, 8 July 2015.

Siting wind turbines to minimize raptor collisions: Altamont Pass Wind Resource Area. US Fish and Wildlife Service Golden Eagle Working Group, Sacramento, California, 8 January 2015.

Evaluation of nest boxes as a burrowing owl conservation strategy. Sacramento Chapter of the Western Section, The Wildlife Society. Sacramento, California, 26 August 2013.

Predicting collision hazard zones to guide repowering of the Altamont Pass. Conference on wind

power and environmental impacts. Stockholm, Sweden, 5-7 February 2013.

Impacts of Wind Turbines on Wildlife. California Council for Wildlife Rehabilitators, Yosemite, California, 12 November 2012.

Impacts of Wind Turbines on Birds and Bats. Madrone Audubon Society, Santa Rosa, California, 20 February 2012.

Comparing Wind Turbine Impacts across North America. California Energy Commission Staff Workshop: Reducing the Impacts of Energy Infrastructure on Wildlife, 20 July 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. California Energy Commission Staff Workshop: Reducing the Impacts of Energy Infrastructure on Wildlife, 20 July 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. Alameda County Scientific Review Committee meeting, 17 February 2011

Comparing Wind Turbine Impacts across North America. Conference on Wind energy and Wildlife impacts, Trondheim, Norway, 3 May 2011.

Update on Wildlife Impacts in the Altamont Pass Wind Resource Area. Raptor Symposium, The Wildlife Society—Western Section, Riverside, California, February 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. Raptor Symposium, The Wildlife Society - Western Section, Riverside, California, February 2011.

Wildlife mortality caused by wind turbine collisions. Ecological Society of America, Pittsburgh, Pennsylvania, 6 August 2010.

Map-based repowering and reorganization of a wind farm to minimize burrowing owl fatalities. California burrowing Owl Consortium Meeting, Livermore, California, 6 February 2010.

Environmental barriers to wind power. Getting Real About Renewables: Economic and Environmental Barriers to Biofuels and Wind Energy. A symposium sponsored by the Environmental & Energy Law & Policy Journal, University of Houston Law Center, Houston, 23 February 2007.

Subject: Comments on the Shadowbox Studio Project

Dear Mr. Franco,

I have reviewed vehicle miles traveled ("VMT") impacts in the City of Santa Clarita Shadowbox Project Draft Environmental Impact Report ("DEIR"). I make the following findings:

1) The proposed project is not in a VMT-efficient location as is demonstrated in a City of Santa Clarita graphic included in the DEIR. The DEIR's assertion that the project is in a VMT-efficient location is based on an outdated transportation model with a base year of 2012 that is known to underestimate commute VMT. Census data indicate that the actual average commute distances of workers employed in the project area is 2.8 times as great as asserted in the DEIR. The DEIR must be revised to include a realistic estimate of VMT impacts. **O6-60**

2) The DEIR estimates that the project would create about 2,333 direct jobs. Many of these jobs would not represent permanent workers but instead be workers attached to temporary projects including many independent contractors as well as many employed by offsite businesses. This is inherently different from a large warehouse project or large retail project where permanent workers would include a large proportion of local workers. The project submittal should include a thorough analysis of the likely composition of the workforce and compute realistic commute distances based on Census data. **O6-61**

3) The project's VMT impacts require mitigation, but most workers would commute to the project by single-occupant auto. The Metrolink stop located 0.5 mile from the project's entrance fails to provide adequate service for reverse commuters from locations to the south because there is 3 hours between afternoon/early evening departures. The DEIR asserts the project will provide flexible work schedules, telecommuting, and guaranteed rides home, but it doesn't explain how these can be implemented in this project. Who is providing these benefits? Is it the overall project owner, those who lease particular soundstages, short-term renters of soundstages, or the businesses who employ the workers? What benefits do independent contractors get and how are they provided? Are workers able to quit work at a certain time to catch their bus while video shooting continues? The DEIR does not answer these questions.

O6-62

4) The project's greenhouse gas ("GHG") emissions are also underestimated in the DEIR. The number of daily vehicle trips assumed in the air quality analysis is less than the number of trips reported in the transportation analysis. The default average trip lengths used in the air quality analysis are lower than the distances calculated from Census data. After VMT is calculated correctly, the GHG analysis should be redone with the corrected VMT.

O6-63

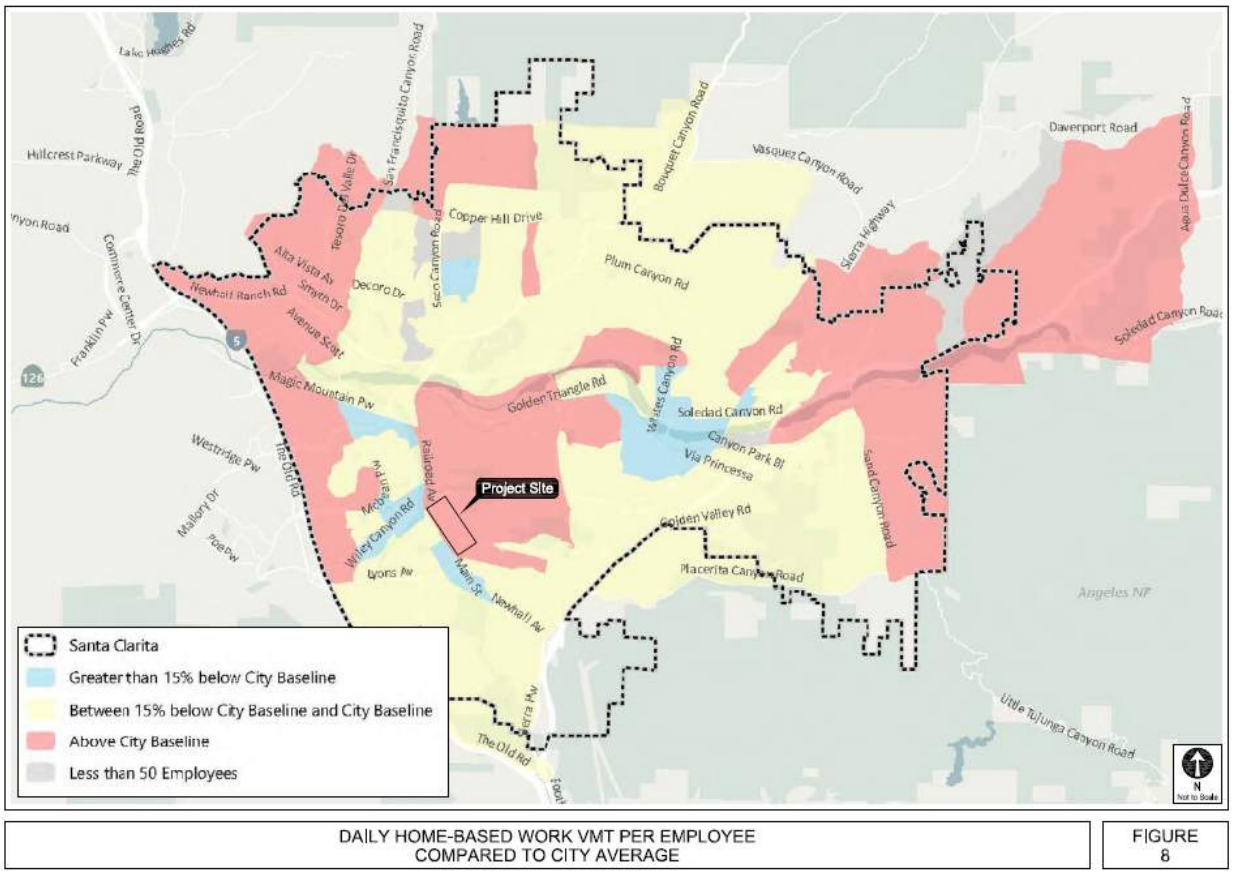
The Proposed Project is Not in a VMT-Efficient Location

The DEIR documents that the project is not in a VMT-efficient location. It states:

> As shown in Figure 8, the Project Site lies within zones that have a greater daily home-based work VMT per employee than the City baseline and, therefore, requires further study. (App. L, p. 30)

This figure is reproduced below as Figure 1.

Figure 1: DEIR Graphic Showing Project is NOT in VMT-Efficient Area (reproduced from Appendix L, Figure 8, p. 32)



The map shown in Figure 1 is reproduced from *Transportation Analysis Updates in Santa Clarita* (May 19, 2020) and is derived from a Southern California Association of Governments ("SCAG") model with a base year of 2012 developed for the *2016 Regional Transportation Plan / Sustainable Communities Strategy* (*Transportation Updates*, p. 13).

The DEIR asserts that applying the same SCAG transportation model shows that the project is in a VMT-efficient location. The DEIR states:

> According to the Transportation Assessment prepared for the Project (see Appendix L and Section 4.14, Transportation, of this Draft EIR), the average home-based-work VMT per employee for the City of Santa Clarita is 17.9. The Project would have a home-

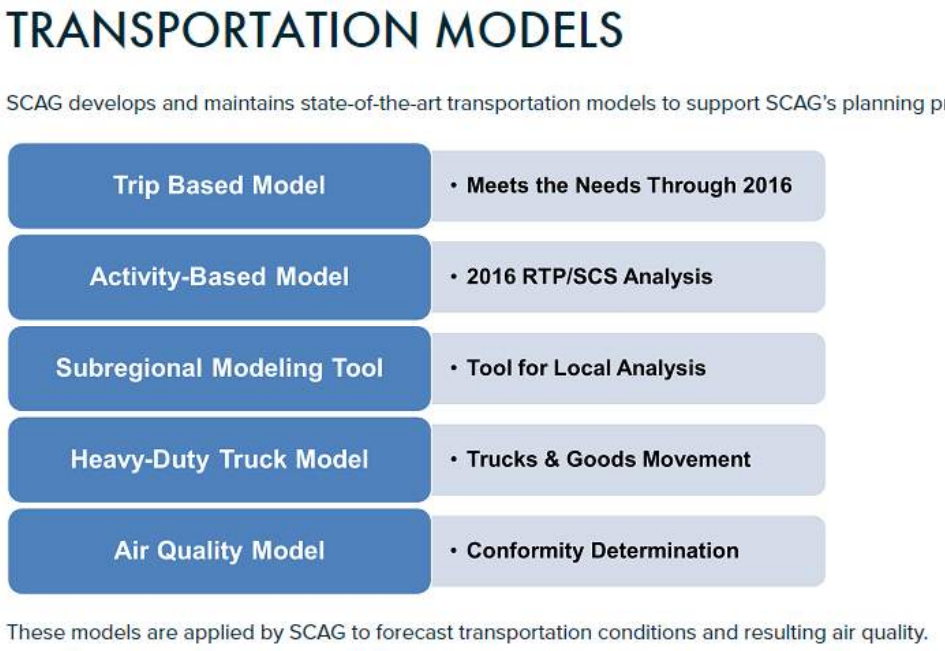
O6-64

> based-work VMT per employee of 14.0, which is less than the Citywide average. (DEIR, p. 4.2-21)

As the same model was used was used both to create Figure 1 and the DEIR, it would be expected that the result would be the same, i.e., that the project is not located in a VMT-efficient location. In addition, the citywide average given in the DEIR excerpt reproduced above, 17.9, is different than the citywide average given in the *Transportation Analysis Updates in Santa Clarita*, 21.0 (Table 6, p. 21). These discrepancies are not explained or justified in the DEIR. This makes me skeptical about the DEIR modeling.

Even if the DEIR analysis was done properly and the results were reported accurately, this analysis would be invalid because the model applied is outdated and known to underestimate commuting VMT. The SCAG 2016 RTP/SCS Regional Travel Demand Model was replaced in 2020 with a newer and much more complex regional travel demand model with a base year of 2016. Figure 2 shows that SCAG considers the model used in the DEIR only "meets the needs through 2016."

Figure 2: SCAG Transportation Models[1]



O6-64
Continued

[1] https://scag.ca.gov/transportation-models

The problems with the model used in the DEIR are much greater than just that it is out of date. The VMT metric in the DEIR represents average commute distance. Both the 2016 and 2020 SCAG models used the 2011 California Household Travel Survey ("CHTS") data in estimating commute trip length.[2] [3] But the 2020 effort also relied on Census data and the 2020 model validation report stated:

> The workplace location model was compared to trip length frequency information obtained from the 2011 CHTS and the 2014 Longitudinal Employment – Household Dynamics (LEHD) dataset, and County-to-County flows obtained from the 2011 CHTS and 2011-2015 Census Transportation Planning Product (CTPP). The LEHD data was used to calibrate the tail of the trip length distribution, because there were few observations of these long commute patterns captured in the CHTS.

For the SCAG region, the 2020 report on the updated model reported that the average commute distances across the entire region are:

- CHTS 12.5 miles, vs.
- LEHD (Census) 20.6 miles.

O6-64
Continued

The Census average commute length is **65% higher** than the average in the CHTS data that were used to calibrate the outdated model used in the DEIR. Any commute length estimates based on the outdated model, including those reported in the DEIR, significantly underestimate work trip VMT. Furthermore, this was known by travel demand modelers in the region in 2020 – well prior to the DEIR estimate that was prepared in 2021 (Iteris, Inc. memo dated August 24, 2021, included in DEIR App. L, p. 309-312 of 2130). The City should update its guidance, but outdated guidance is not an adequate excuse for mispresenting the project's VMT impacts.

Rather than relying on an outdated model known to greatly underestimate commute trip lengths, it is much more accurate to use actual data on trip lengths. The U.S. Census Bureau publishes Longitudinal Employer-Household Dynamics ("LEHD") Origin-Destination Employment Statistics ("LODES") data that provide detailed geographic data about workers.

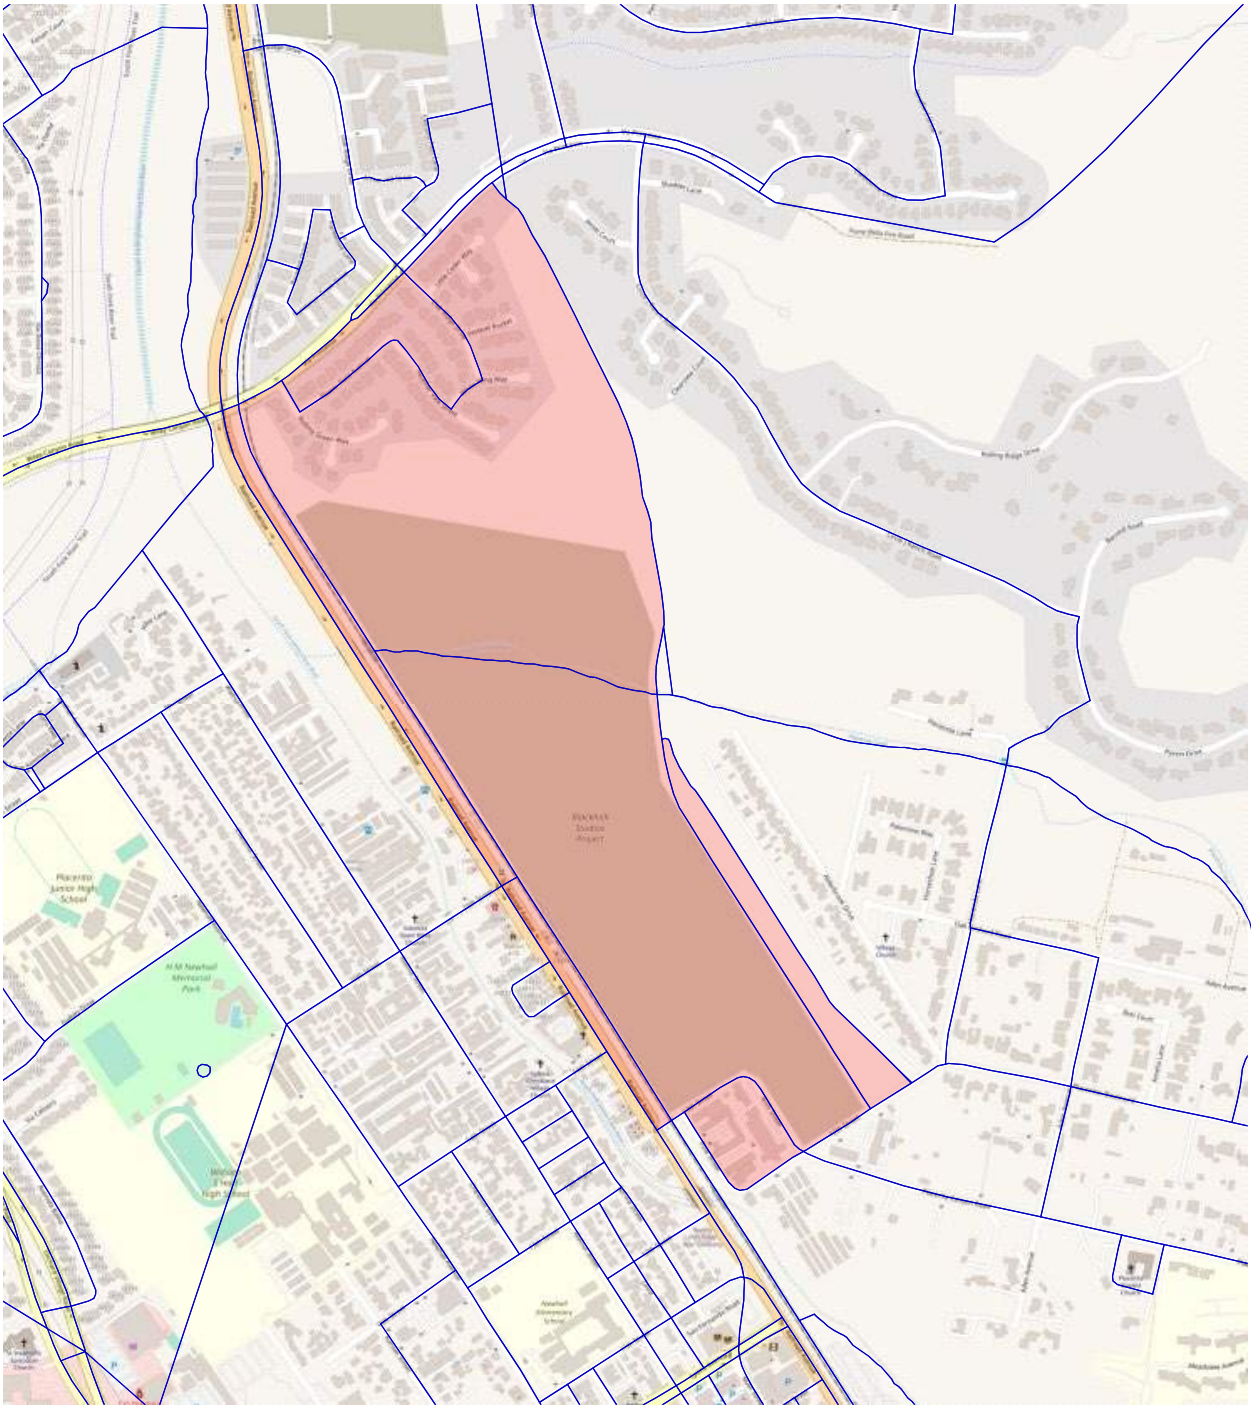
The LODES data include three parts:

- number of workers at the home location,
- number of jobs at the workplace location, and
- flows of workers from home location to workplace location.

[2] https://scag.ca.gov/sites/main/files/file-attachments/scag_rtdm_2012modelvalidation.pdf?1605571641 , p. 5-6 – 5-7.
[3] https://scag.ca.gov/sites/main/files/file-attachments/validationsummaryreport_20rtp_final_2020_05.pdf?1659028273, p. 5-3.

Focusing on workers commuting to the area of Santa Clarita mapped in Figure 3, Figures 4 shows current[4] home locations from the LODES data.

Figure 3: Project Area Used in LODES Mapping

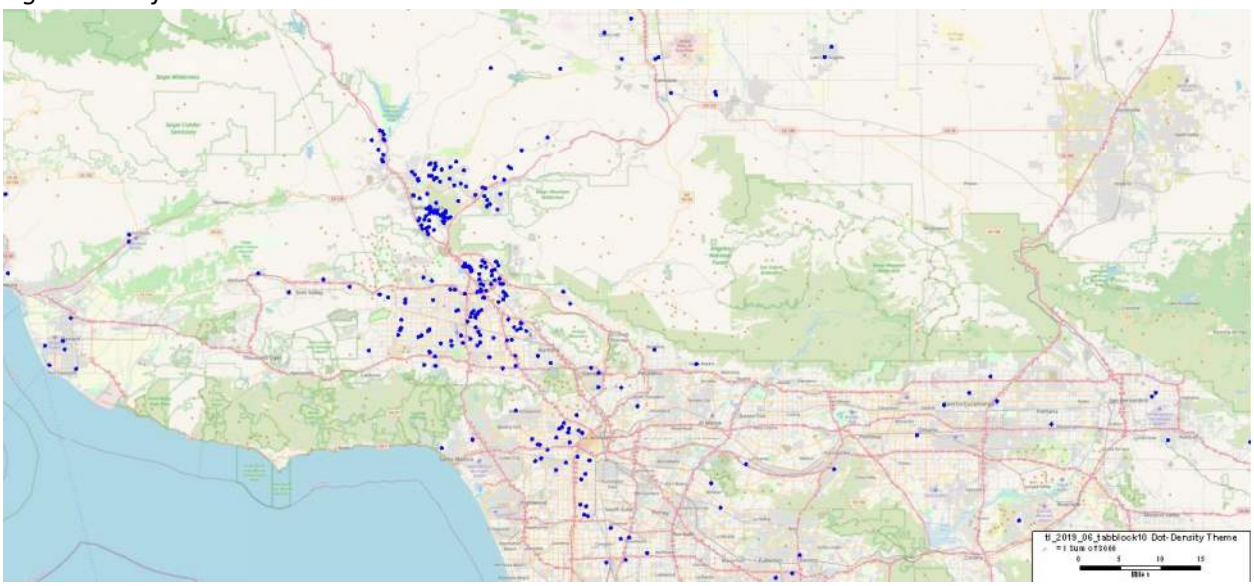


Note: the blue lines delineate Census blocks.

O6-64
Continued

[4] 2019 data used to avoid pandemic effects.

Figure 4: Project Area Workers' Home Locations[5]



O6-64
Continued

While there is a cluster of workers with short commutes, the residences of project area workers are spread widely across southern California. After subtracting out LODES trips that appear to be longer than 100 miles – some of which may errors and could skew the average too high – the mean distance between home and work for project area workers is 19.6 miles.[6] Several adjustments must be made to compare this to the model estimate of home-based VMT per worker. First, this is a one-way distance which needs to be doubled for round trips. Second, it a is a straight-line "as crows fly" distance and the road distances are longer. On the other hand, some commuters carpool and not all commutes are by auto. Based on my experience, I make the following adjustments to the LODES average trip distance:

- converting one-way to two-way x 2.0
- converting from straight-line to road distance x 1.1
- adjustment for carpooling, transit, walking and biking x 0.9.

The resulting average is 38.7 VMT per worker per day, on average. This is more than 2.8 times the 14.0 VMT per day the DEIR estimates.

There is no evidence that the outdated regional model with a base year of 2012 accurately represents commute trip lengths to the project area, and the model estimates are refuted by Census data. Therefore, it is irresponsible to rely on the model to claim that the project will not have significant VMT impacts. More accurate VMT estimates should be prepared based on Census data.

[5] LODES data (https://lehd.ces.census.gov/data/) mapped at the Census Tract level.
[6] Straight line distance calculated from the center of the home Census Block to the center of the work Census Block using Geographic Information Systems ("GIS") software.

The Project's Scale and Characteristics Require Special Attention to Commute VMT

The DEIR estimates that the project would create about 2,333 direct jobs, which exceeds SCAG's forecast of 1,931 additional jobs from 2022-2026 for the entire city (DEIR pg. 4.12-1, Table 4.12-1). Many of these jobs would not represent permanent workers but instead be workers attached to temporary projects including many independent contractors as well as many employed by offsite businesses. This is inherently different from a large warehouse project or large retail project where permanent workers would include a large proportion of local workers.

O6-65

The temporary workers at this site would be drawn from the large Los Angeles County labor force employed in the film and video industry. Therefore, it is possible that commuters to this project would commute longer distances, on average, than those currently commuting to in the project area. The project submittal should include a thorough analysis of the likely composition of the workforce and compute realistic commute distances based on Census data.

The VMT Impacts Require Mitigation But Most Workers Would Commute to the Project by Single-Occupant Auto

The proposed project is not in a VMT-efficient location and may induce unusually long commutes given the characteristics of the project. Therefore, mitigating VMT impacts is essential. The DEIR includes all the usual language on VMT reduction, but these usual measures will not result in significant VMT mitigation in this case.

The DEIR states:

> Project amenities, such as bicycle parking spaces and proximity to multiple public transit options, would reduce anticipated transportation fuel use by encouraging alternative modes of transportation. (DEIR, p. 4.5-11)

O6-66

Few of the workers will live close enough to the project for walking or bicycling to be realistic alternatives.

The transit options listed in the DEIR focus on the "Jan Heidt Newhall Metrolink Station, which is approximately 0.5 mile south of the Project Site, or a 10-minute walk" (DEIR, p. 4-5-11) that also includes connecting bus routes. The bus routes would serve some of the relatively few workers living in Santa Clarita, and Metrolink service could serve some workers from Lancaster and Palmdale with one-hour weekday peak period, peak direction headways. However, it would be almost worthless for reverse commuters from the south where most of the industry's labor force resides. The last two weekday southbound departures from the Newhall station are at 4:29 p.m. and 7:29 p.m., i.e., 3 hours apart.[7]

The DEIR includes the same sort of Transportation Demand Management (TDM) verbiage that is in almost every California project DEIR, but this language is disconnected from the realities of the proposed project. The programs listed in the DEIR include:

- Flexible work schedules and telecommuting programs,
- Carpool programs and support, and,
- Tenant-based guaranteed ride home (GRH) program. (DEIR, p. 4.14-12)

[7] https://metrolinktrains.com/schedules/?type=line&lineName=Antelope+Valley+Line

In the proposed project – who is providing these benefits? Is it the overall project owner, those who lease particular soundstages, short-term sound stage renters, or the businesses who employ the workers? What benefits do independent contractors get and how are they provided? How are these TDM provisions enforced? How do "flexible work schedules" relate to the open-ended nature of film and video shoots in the soundstages? Are workers able to quit work at a certain time to catch their bus while shooting continues? The DEIR does not answer these questions.

O6-66 Continued

The Project's GHG Impacts Also are Underestimated in the DEIR

The projects GHG impacts are calculated using CalEEMod and are documented in DEIR Appendix C. Mobile emissions are estimated based on the number of trips times trip distance, i.e., VMT.

The number of trips used in CalEEMod, 7021.82 (DEIR App. C, p. 109 of 242), is lower than the number of trips in the transportation analysis, 7,293 (App. L, p. 34). The CalEEMod analysis should be redone with the correct trip generation number.

O6-67

The trip lengths assumed in CalEEMod are too low. A default home-based work trip length of 16.6 miles was assumed, i.e., a round trip of 33.2 miles. Although 33.2 miles is much greater than the 14.0 miles asserted in the VMT section of the DEIR, it is lower than the 38.7 miles estimated from Census data for the existing commuting to the project area After proper estimation of commute lengths, these lengths should be used in redoing the CalEEMod analysis.

Sincerely,

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (32 Years, 18 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

PUBLICATIONS AND PRESENTATIONS (partial list)

DTA Love: Co-leader of workshop on Dynamic Traffic Assignment at the June 2019 Transportation Research Board Planning Applications Conference.

Forecasting the Impossible: The Status Quo of Estimating Traffic Flows with Static Traffic Assignment and the Future of Dynamic Traffic Assignment. *Research in Transportation Business and Management* 2018.

Re: Request for *Immediate Access* to Documents Referenced or Relied Upon in the Draft Environmental Impact Report - Shadowbox Studios Project ((Master Case 21-109)

Dear Mr. Crawford, Ms. Cusick, and Ms. Iverson:

We are writing on behalf of the Coalition for Responsible Equitable Economic Development in Los Angeles (CREED LA) to request any and all documents referenced or relied upon in the Draft Environmental Impact Report for the Shadowbox Studios Project ("Project") (Master Case No. 21-109) proposed by L.A. Railroad 93, LLC ("Applicant"). *This request excludes a copy of the DEIR and its appendices. This request also excludes any documents that are currently available on the City of Santa Clarita website, as of today's date.* O6-68

The Project proposes to develop a full-service film and television studio campus that would consist of approximately 476,000-square feet of sound stages; approximately 571,000-square feet of workshops, warehouses, and support uses; approximately 210,000-square feet of production and administrative offices, and approximately 37,500-square feet of catering and specialty service areas.

printed on recycled paper

The approximately 93-acre Project site is generally located at the northeast corner of Railroad Avenue and 13th Street and bounded by 12th Street, Arch Street, and 13th Street on the south; Railroad Avenue on the west; Metropolitan Water District (MWD) right-of-way (ROW) on the east; and HOA maintained slopes associated with adjacent residential uses to the north (APNs: 2834-001-007; 2834-001-012 to -015; 2834-002-046; 2834-003-044; 2834-004-045; 2834-005-041; 2834-006-041; 2834-007-045; 2834-008-039; 2834-010-043; 2834-011-021; 2834-012-023; 2834-013-041; 2834-014-043; 2834-015-021; 2834-016-041; 2834-017-021; 2834-020-111; 2834-020-114; 2834-021-134; 2834-022-067).

O6-68
Continued

Our request for all documents referenced or relied upon in the DEIR is made pursuant to the California Environmental Quality Act (CEQA"), which requires that all documents referenced, and incorporated by reference, in an environmental review document be made available to the public for the entire comment period.[1]

We request ***immediate access*** to review the above documents pursuant to CEQA. If the requested documents are in electronic format, please send them via a file hosting service such as Dropbox. If the electronic documents are 10 MB or less (or can be easily broken into chunks of 10 MB or less), please email them to ssannadan@adamsbroadwell.com as attachments. Otherwise, please send the above requested items by U.S. Mail to our South San Francisco Office as follows:

Re: Request for Extension of Comment Period for the Draft Environmental Impact Report for Shadowbox Studios Project (Master Case 21-109) and Immediate Access to Reference Documents

Dear Mr. Crawford and Ms. Iverson:

We are writing on behalf of the Coalition for Responsible Equitable Economic Development in Los Angeles (CREED LA) to respectfully request that the City of Santa Clarita ("City") extend by at least 30 days the public review and comment period for the Draft Environmental Impact Report ("DEIR") prepared for the Shadowbox Studios Project (Master Case 21-109) ("Project"), which currently ends on May 22, 2023.

We are requesting an extension due to the City's failure to provide timely access to all documents referenced in the DEIR. We ask that the City immediately comply with our April 27, 2023 request for immediate access to all documents referenced and incorporated by reference in the DEIR, including but not limited to (1) all documents referenced and incorporated by reference in the DEIR which are not available by weblink; (2) all unlocked native input files for CalEEMod modeling performed for the Project, as referenced in DEIR sections 4.2 and 4.7 and Appendix C; (3) any Excel file(s) prepared by Rincon Consultants, Inc. in connection with its

O6-70

printed on recycled paper

air quality analysis and calculations for the Project; (4) missing documents referenced in DEIR section 4.14 and Appendix L, including Transportation Analysis Updates in Santa Clarita (May 19, 2020), Transportation Analysis Updates in Santa Clarita (June 20, 2023) and the Placerita Meadows EIR Traffic Study; (5) any reports or other documents reflecting an April 27, 2022 site visit by Michael Baker International, as referenced in Appendix D, pg. 18.

On April 27, 2023, our office submitted a request, pursuant to the California Environmental Quality Act ("CEQA"),[1] for immediate access to any and all *documents referenced or relied upon in the Draft Environmental Impact Report*, excluding the DEIR, its appendices and documents available on the City of Santa Clarita website as of that date.[2] CEQA's section 21092(b)(1) and CEQA Guidelines section 15087(c)(5) require that "all documents referenced" and "all documents incorporated by reference" in an environmental impact report shall be "readily accessible to the public during the lead agency's normal working hours" during the entire public comment period.[3]

O6-70
Continued

On May 8, 2023, the City responded that it was "in receipt of your public records request," and that because the request involved numerous separate and distinct records, the City claimed an extension pursuant to Government Code section 7922.535(b) to provide the missing documents. The City stated that "pursuant to the extension provision, you will be contacted on or before May 22, 2023, with the availability of the records responsive and appropriate for disclosure."

As an initial matter, our April 27, 2023 request was made pursuant to the provisions of CEQA, not the California Public Records Act.[4] Therefore, the extension provision cited by the City (Government Code section 7922.535(b)) is inapplicable.

Moreover, CEQA compels a lead agency to make all documents referenced in an environmental impact report "available for review" during the entire public comment period.[5] The courts have held that the failure to provide even a few pages

[1] Pub. Resources Code §§ 21000 *et seq*.
[2] Letter to Jason Crawford and Erika Iverson, City of Santa Clarita from Sheila Sannadan, Adams Broadwell Joseph & Cardozo re: Request for Immediate Access to Documents Referenced in the Draft Environmental Impact Report – Shadowbox Studios Project (Master Case 21-109) (April 27, 2023).
[3] Pub. Resources Code § 21092(b)(1); 14 C.C.R. § 15087(c)(5).

printed on recycled paper

of a CEQA document for a portion of the public review period invalidates the entire CEQA process, and that such a failure must be remedied by permitting additional public comment.[6] It is also well settled that a CEQA document may not rely on hidden studies or documents that are not provided to the public.[7]

By failing to make all documents and underlying data referenced in the DEIR readily available during the entirety of the public comment period, the City is depriving members of the public the ability to meaningfully comment on the potentially significant environmental impacts of the Project and is violating the procedural mandates of CEQA. The City's suggestion that it will not make documents referenced in the DEIR available for our review until May 22, 2023—the last day to submit comments on the Project—plainly violates CEQA and would preclude any meaningful public review and comment. Therefore, we respectfully request that the City extend the public review and comment period on the DEIR by at least 30 days from the date on which the City releases ***all*** the DEIR reference documents for public review.

O6-70
Continued

Given the short time before the current public review and comment period ends, please contact me as soon as possible with your response to this request, but no later than close of business on **Monday, May 15, 2023**. Thank you for your consideration and prompt response to this request.

Sincerely,

Richard M. Franco

Re: Request for Mailed Notice of Actions and Hearings Related to Shadowbox Studios Project (Master-Case No. 21-109) (APNs 2834-001-007; 2834-001-012 to -015; 2834-002-046; 2834-003-044; 2834-004-045; 2834-005-041; 2834-006-041; 2834-007-045; 2834-008-039; 2834-010-043; 2834-011-021; 2834-012-023; 2834-013-041; 2834-014-043; 2834-015-021; 2834-016-041; 2834-017-021; 2834-020-111; 2834-020-114; 2834-021-134; 2834-022-067).

Dear Mr. Crawford, Ms. Cusick, and Ms. Iverson:

We are writing on behalf of Coalition for Responsible Equitable Economic Development Los Angeles ("CREED LA") to request mailed notice of the availability of any environmental review document, prepared pursuant to the California Environmental Quality Act, related to the Shadowbox Studios Project ("Project") proposed by L.A. Railroad 93, LLC ("Applicant").

O6-72

The Project proposes to develop a full-service film and television studio campus that would consist of approximately 476,000-square feet of sound stages; approximately 571,000-square feet of workshops, warehouses, and support uses; approximately 210,000-square feet of production and administrative offices, and

printed on recycled paper

approximately 37,500-square feet of catering and specialty service areas. The approximately 93-acre Project site is generally located at the northeast corner of Railroad Avenue and 13th Street and bounded by 12th Street, Arch Street, and 13th Street on the south; Railroad Avenue on the west; Metropolitan Water District (MWD) right-of-way (ROW) on the east; and HOA maintained slopes associated with adjacent residential uses to the north.

O6-72

We also request mailed notice of any and all hearings, meetings and/or actions related to the Project. These requests are made pursuant to Public Resources Code Sections 21092.2, 21080.4, 21083.9, 21092, 21108, 21152, and 21167(f), and Government Code Section 65092, which require local agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

Please send the above requested items by email and U.S. Mail to our South San Francisco Office as follows:

Re: Agenda Item #1- May 16, 2023 Planning Commission Hearing on Shadowbox Studios Project (Master Case 21-109)

Dear Chair Berlin, Honorable Planning Commission members, Mr. Crawford and Ms. Iverson:

We are writing on behalf of the Coalition for Responsible Equitable Economic Development Los Angeles ("CREED LA") with respect to the May 17, 2023 Planning Commission Agenda Item #1, the Shadowbox Studios Project (Master Case 21-109) ("Project") proposed by L.A. Railroad 93, LLC ("Applicant"). The Project proposes to develop a full-service film and television studio campus that would consist of approximately 476,000-square feet of sound stages; approximately 571,000-square feet of workshops, warehouses, and support uses; approximately 210,000-square feet of production and administrative offices, and approximately 37,500-square feet of catering and specialty service areas. The approximately 93-acre Project site is generally located at the northeast corner of Railroad Avenue and 13th Street and bounded by 12th Street, Arch Street, and 13th Street on the south; Railroad Avenue on the west; Metropolitan Water District (MWD) right-of-way (ROW) on the east; and HOA maintained slopes associated with adjacent residential uses to the north. O6-73

The staff report for the May 16 hearing recommends that the Planning Commission take the following actions: (1) receive the staff presentation in response to Planning Commission direction; (2) continue the public hearing to receive

printed on recycled paper

testimony from the applicant and the public; (3) close the public hearing and provide direction to staff on the hearing schedule; and (4) continue the Project to June 20, 2023. For the reasons set forth below, it is premature for the Planning Commission to act on the Project or to set dates for decisional hearings because the public comment period on the Project's Draft Environmental Impact Report ("DEIR") remains open, and the City must review and respond to comments on the DEIR before moving forward with any Project approval actions. CREED LA respectfully requests that the Planning Commission direct City staff to extend the public comment period for the Project's Draft Environmental Impact Report ("DEIR") and continue the public hearing to a date after the close of public comment on the DEIR.

I. STATEMENT OF INTEREST

CREED LA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental and public service impacts of the Project. The coalition includes the Sheet Metal Workers Local 105, International Brotherhood of Electrical Workers Local 11, Southern California Pipe Trades District Council 16, and District Council of Iron Workers of the State of California, along with their members, their families, and other individuals who live and work in the City of Los Angeles.

O6-73
Continued

Individual members of CREED LA and its member organizations live, work, recreate, and raise their families in the City of Santa Clarita and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CREED LA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

printed on recycled paper

II. THE PLANNING COMMISSION SHOULD CONTINUE THE HEARING AND EXTEND THE PUBLIC COMMENT PERIOD ON THE DEIR DUE TO FAILURE TO COMPLY WITH CEQA

CREED LA is in the process of reviewing the Project's DEIR with its experts and plans to submit legal and technical comments prior to the close of the public comment period, which currently ends on May 22, 2023. Based on our review of the DEIR and available supporting documents, it appears that the DEIR fails to comply with the requirements of the California Environmental Quality Act[1] ("CEQA") as it fails to disclose, analyze and mitigate all of the Project's potentially significant impacts, including impacts on air quality, greenhouse gas emissions, biological resources, noise, and transportation.

Any Planning Commission action on the Project, including the proposed recommendations to close the public hearing and set dates for decisional hearings, is premature at this time because the public comment period on the DEIR remains open. CREED LA and other members of the public have yet to provide substantive comments on the DEIR, and the City must review and address those comments before closing public comment and conducting Project approval hearings.[2] Revision and recirculation of the DEIR may also be required prior to release of a Final EIR and any hearings on the Project.[3] Accordingly, CREED LA respectfully requests that the Planning Commission defer any action on the Project and continue the public hearing to a date after the close of public comment on the DEIR.

O6-73
Continued

In addition, we request that the City extend the public review and comment period for the DEIR on the grounds that the City failed to make available all of the documents referenced in and relied upon by the DEIR during the entire public comment period, in violation of CEQA. We first submitted a request for access to such documents pursuant to CEQA on April 27, 2023.[4] On May 8, the City responded that "you will be contacted on or before May 22, 2023 [i.e., the last day to submit public comments on the DEIR], with the availability of the records responsive and appropriate for disclosure."

[1] Pub. Resources Code, §§ 21000 et seq.; 14 Cal. Code Regs. ("C.C.R") §§ 15000 et seq.
[2] 14 C.C.R. § 15088 (b) (written responses to public comments on a DEIR must include disposition of significant environmental issues raised in comments, including any revisions to the proposed project to mitigate anticipated impacts or objections).
[3] Pub. Resources Code § 21092.1; 14 C.C.R. § 15088.5.
[4] April 27, 2023 letter from Sheila Sannadan, Adams Broadwell Joseph & Cardozo to Jason Crawford, Erika Iverson and Mary Cusick re Request for Immediate Access to Documents Referenced or Relied Upon in the Draft Environmental Impact Report-Shadowbox Studios Project.

printed on recycled paper

On May 12, 2023, we requested that the City extend the public comment period as the City had not provided access to all of the DEIR reference documents.[5] We reiterate that request here, and note that there are at least two additional pending requests for an extension of the DEIR comment period.[6] CREED LA's request is made pursuant to CEQA, which requires that "all documents referenced in the draft environmental impact report or negative declaration" be available for review and "readily accessible" during the entire comment period.[7]

Our May 12 request for extension of time included a demand that the City immediately comply with our April 27, 2023 request for immediate access to all documents referenced and incorporated by reference in the DEIR, including but not limited to (1) all documents referenced and incorporated by reference in the DEIR which are not available by weblink; (2) all unlocked native input files for CalEEMod modeling performed for the Project, as referenced in DEIR sections 4.2 and 4.7 and Appendix C; (3) any Excel file(s) prepared by Rincon Consultants, Inc. in connection with its air quality analysis and calculations for the Project; (4) missing documents referenced in DEIR section 4.14 and Appendix L, including Transportation Analysis Updates in Santa Clarita (May 19, 2020), Transportation Analysis Updates in Santa Clarita (June 20, 2023) and the Placerita Meadows EIR Traffic Study; (5) any reports or other documents reflecting an April 27, 2022 site visit by Michael Baker International, as referenced in Appendix D, pg. 18.

O6-73
Continued

Without access to these critical DEIR reference documents during the entire public comment period, CREED LA and other members of the public have been precluded from having a meaningful opportunity to comment on the DEIR as required by CEQA. Without access to these documents, CREED LA and other members of the public have been unable to evaluate the accuracy of the City's impact analysis, or the efficacy of the City's proposed mitigation measures.

CEQA compels a lead agency to make all documents referenced in an environmental impact report "available for review" during the entire public comment period.[8] The courts have held that the failure to provide even a few pages of a CEQA document for a portion of the public review period invalidates the entire CEQA process, and that such a failure must be remedied by permitting additional

[5] May 12, 2023 letter from Richard M. Franco, Adams Broadwell Joseph & Cardozo to Jason Crawford, Erika Iverson and Mary Cusick re Request for Extension of Comment Period for the Draft Environmental Impact Report for Shadowbox Studios Project.

printed on recycled paper

public comment.[9] It is also well settled that a CEQA document may not rely on hidden studies or documents that are not provided to the public.[10]

On May 15, 2023, the City produced a number of the DEIR reference documents requested, with only a week remaining in the DEIR public comment period. This belated production deprived CREED LA of timely access to the documents, and does not cure the City's failure to make these documents available during the entire public comment period. By failing to make all documents and underlying data referenced in the DEIR readily available during the entirety of the public comment period, the City has denied CREED LA and members of the public the ability to meaningfully comment on the potentially significant environmental impacts of the Project in violation of CEQA's procedural mandates. Even with the belated document production, the size of the DEIR and the Project's complexity make it difficult to effectively review and comment on the DEIR by the current comment deadline of May 22, 2023. Therefore, we respectfully request that the City extend the public review and comment period on the DEIR to at least June 14, 2023, which is 30 days after the date on which the City released the missing DEIR reference documents for public review.

O6-73
Continued

Finally, we note that CREED LA did not receive formal notice of the May 16, 2023 Planning Commission hearing, despite our express written request for such notice. On April 27, 2023, we sent a letter via email and U.S. Mail to the City Clerk and the Director of Community Development requesting "**mailed notice of any and all hearings, meetings and/or actions related to the Project.** [emphasis in original]"[11] The letter noted that these requests were made pursuant to Public Resources Code Sections 21092.2, 21080.4, 21083.9, 21092, 21108, 21152, and 21167(f), and Government Code Section 65092, which require local agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body. We only learned of the May 16 hearing by chance, in an email by Director Crawford in response to our May 12 letter requesting an extension of the DEIR public comment period. We hereby reiterate our request for mailed and emailed notice of any and all hearings, meetings and/or actions related to the Project.

III. CONCLUSION

For the foregoing reasons, CREED LA requests that the Planning Commission defer any consideration of the Project and the DEIR, extend the DEIR public review and comment period, and continue the public hearing to a date after the close of the public review and comment period. O6-73 Continued

Thank you for your consideration of these comments.

Sincerely,

Richard M. Franco

Letter No. O6

Richard Franco
Coalition for Responsible Equitable Economic Development in Los Angeles
c/o Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Response to Comment No. O6-1

This introductory comment states that the letter is written on behalf of the Coalition for Responsible Equitable Economic Development in Los Angeles (CREED LA) and provides a summary description of the Project. Note that the square footages stated in the comment differ from the square footages provided on page 2.0-1 in Section 2.0, Project Description, of the Draft EIR, which are as follows:

> "…approximately 475,500 square feet of sound stages; approximately 565,400 square feet of workshops, warehouses, and support uses; approximately 209,300 square feet of production and administrative offices; and approximately 35,600 square feet of catering and other specialty services."

The comment does not address the adequacy of the Draft EIR. Accordingly, the comment and discrepancies are noted, and no additional response is warranted.

Response to Comment No. O6-2

The comment claims that the Draft EIR failed to comply with CEQA and must be revised because it did not adequately analyze and disclose many of the Project's significant environmental impacts and failed to propose feasible and enforceable mitigation measures to reduce impacts to a less-than-significant level. The comment also claims that there is substantial evidence that the Project will result in significant unmitigated impacts related to air quality, health risks, noise, biological resources, transportation and greenhouse gas (GHG) emissions. Specific issues raised in the comment related to these environmental topics are addressed in Response to Comment Nos. O6-7 through O6-67 below. As demonstrated therein, the Draft EIR fully complied with all of CEQA's mandates, and the comment presents no new information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR. The comment is noted for the record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-3

The comment references the comments on the Draft EIR provided by James Clark with Clark and Associates related to air quality, Ani Toncheva with Wilson Ihrig related to noise, Shawn Smallwood related to biological resources, and Norman Marshall with Smart Mobility related to transportation and states that the City must respond to such comments separately and fully. Responses to comments provided by Mr. Clark, Ms. Toncheva, Mr. Smallwood, and Mr. Marshall are provided in Response to Comment Nos. O6-27 through O6-67 below.

Response to Comment No. O6-4

The comment provides a description of CREED LA and its purpose and claims that CREED LA members would be directly affected by the Project's environmental and health and safety impacts. This claim is not supported by substantial evidence. As demonstrated in the Draft EIR and further

explained in Response to Comment Nos. O6-7 through O6-67 below, the Project would not result in significant environmental or health and safety impacts. This comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-5

The comment provides the commenter's understanding of the legal background of CEQA. This comment does not raise any issues related to the content or adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-6

Please refer to Response to Comment No. O2-2 regarding the request for access to all documents referenced in the Draft EIR.

Response to Comment No. O6-7

The comment states that the Draft EIR's description of baseline conditions for biological resources is deficient for several reasons. First, the biological survey performed by Rincon Consultants, Inc. (Rincon) was incomplete and not fully documented because it lacked crucial information, such as when the survey began and its duration. The comment questions whether the 23 species of vertebrate wildlife detected by Rincon were representative of actual site conditions because the report was missing the context of start time and duration. To demonstrate the importance of context, the comment notes that Dr. Smallwood's associate detected nearly twice this number of vertebrate wildlife in 3.5 hours. The commenter acknowledges that Rincon reported that 23 additional wildlife species were detected during separate surveys for burrowing owl and California gnatcatcher, but those additional sightings were not included in the Draft EIR.

The biological surveys performed by Rincon were intended to assess current conditions of the Project Site for potentially supporting sensitive biological resources (e.g., special-status species, aquatic resources, sensitive habitats and vegetation, and wildlife movement). Based on the results of the initial habitat assessment, focused surveys were performed for specific special-status species determined to have the potential to occur based on the distribution and quality of the vegetation and associated habitats on-site, such as for western burrowing owl and coastal California gnatcatcher. The species referenced in this comment are common and are not "special status" in accordance with CEQA. Additionally, the discrepancy between the number of species observed by Rincon during the reconnaissance survey on January 20, 2022, and the number observed by Dr. Smallwood's associate on May 14, 2023, can be attributed to seasonal variability. Furthermore, information on the additional species observed by Rincon is provided in the Appendix D of the Draft EIR (see Table 2 of the Burrowing Owl Habitat Assessment and Focused Survey Results for the Blackhall Studios Project [Burrowing Owl Report] and Appendix A of the Blackhall Property Project Coastal California Gnatcatcher Focused Survey Report [Coastal California Gnatcatcher Report], both of which were included in Appendix D of the Draft EIR).

Response to Comment No. O6-8

The comment states that the focused detection surveys for burrowing owl and California gnatcatcher performed by Rincon failed to comply with minimum standards of the available survey protocols for these species.

Focused surveys were completed by a qualified biologist with over 20 years of experience and an active U.S. Fish and Wildlife Service (USFWS) permit in compliance with USFWS Section 10(a) of the Federal Endangered Species Act (FESA), Special Terms and Conditions for Endangered and Threatened Wildlife Species Permit. The survey included six breeding season surveys in accordance with the USFWS current Coastal California Gnatcatcher Presence/Absence Survey Protocol. According to the USFWS, the protocol for the breeding season was designed to provide a 95-percent confidence level of detecting coastal California gnatcatchers at a site when they are present. The accepted standard for protocol presence/absence surveys for coastal California gnatcatcher is either six breeding season surveys or nine non-breeding season surveys; USFWS does not require completion of both breeding and non-breeding season surveys for the results to be considered valid. Furthermore, the potential habitat on the Project Site for supporting coastal California gnatcatcher is of marginal quality, in addition to the site being generally surrounding by existing development and urban sprawl and relatively fragmented from suitable habitat for coastal California gnatcatcher. Accordingly, conducting additional surveys during the non-breeding season (July 1 through March 14) is not necessary.

With regards to burrowing owl, the comment states that the burrowing owl surveys failed to meet nearly half of the applicable California Department of Fish and Wildlife (CDFW) survey and reporting protocols. Rincon performed four breeding season surveys in accordance with the requirements specified in CDFW's Staff Report on Burrowing Owl Mitigation.[17] This included a habitat assessment, focused burrow survey, and focused breeding season owl surveys by systematically searching for potential foraging and nesting habitat within the study area, which included the Project Site plus a 150-meter buffer (where access was available). The surveys were conducted by a qualified biologist with experience and knowledge of burrowing owl life history and sign walking transects spaced approximately 10 meters apart in suitable habitat and were appropriately adjusted to allow for 100-percent visual coverage of the ground surface. Suitable habitat was identified by the presence of low vegetation cover, presence of potentially suitable small mammal burrows, and perch sites. As indicated in the Draft EIR and the Burrowing Owl Report (included in Appendix D of the Draft EIR), no evidence of burrowing owl presence (e.g., direct observations or sign of presence, such as feathers, pellets, tracks, or potentially occupied burrows) was observed during the breeding season surveys.

Based on the above, the surveys for the coastal California gnatcatchers and burrowing owls comply with established protocols for each species and, thus, with the requirements of CEQA as well. As such, the comment's claim that the Draft EIR did not provide substantial evidence to support the findings related to the coastal California gnatcatchers and burrowing owls is incorrect.

Response to Comment No. O6-9

The comment states that an important part of documenting a site's environmental setting is a desktop review, which includes literature and database review and consultation with local experts to inform and augment reconnaissance surveys and to help determine which protocol-level detection surveys should be conducted. The comment suggests that the Draft EIR's desktop review is incomplete and flawed because it neglected readily available species occurrence databases and provided no evidence that any local experts were consulted. The comment indicates that Dr. Smallwood conducted an independent database review and the various Project

[17] State of California Natural Resource Agency, Department of Fish and Game, Staff Report on Burrowing Owl Mitigation, March 7, 2021.

Site visits, which resulted in the identification of 122 special status wildlife species occurring near enough to the Project Site to warrant analysis of their occurrence potential.

However, the comment does not mention which of the 122 species they believe could potentially occur on the Project Site. Rather, the list of species presented in Table 4 of Dr. Smallwood's report identifies those species that occur "In region" "Nearby", "Very close", and "On site". Of the 122 species included in Dr. Smallwood's Table 4 identified as "On site", all are common in the region and non-listed species that include Allen's hummingbird, turkey vulture, red-tailed hawk, Cooper's hawk, California thrasher, and Southern California rufous-crowned sparrow. With the exception of Allen's hummingbird, all of these species were documented in the Biological Assessment Report (included in Appendix D of the Draft EIR). Additionally, many of the 122 species included in Mr. Smallwood's report that are not included in the Draft EIR are derived from unconfirmed sources in eBird (https://eBird.org) and iNaturalist (https://www.inaturalist.org) and include species that require habitat that is not present on, or in the vicinity of, the Project Site. Examples include numerous coastal species, such as Laughing gull, Heermann's gull, western gull, willet, long-billed curlew, whimbrel, California least tern, gull-billed tern, black tern, American white pelican, and California brown pelican, as well as species that are dependent on perennial water sources, such as lakes and ocean, including least bittern, common loon, double-breasted cormorant, white-faced ibis, and osprey. Mr. Smallwood incorrectly alleges that some of these species are "Nearby", which is unsubstantiated and inaccurate.

As indicated in the Draft EIR and the Biological Resources Assessment Report (included in Appendix D of the Draft EIR), the majority of the Project Site consists of non-native wild oat-annual brome grassland. In addition to other disturbed areas on the Project Site, off-highway vehicle trails and other disturbances (e.g., encampments and trash) on the site are evident in the native vegetation communities that are present. Moreover, the Project Site is generally fragmented from intact native habitats in the region and surrounded by development and urban sprawl. Finally, the database reviews performed by Rincon were standard and appropriate for performing Project-level analysis under CEQA. These resources included queries of the USFWS Information for Planning and Consultation online project planning tool (2022), USFWS Planning and Conservation System (2022), CDFW California Natural Diversity Database (2022), and the California Native Plant Society Online Inventory of Rare, Threatened and Endangered Plants of California (2022) to obtain comprehensive information regarding state- and federally-listed species, as well as other special-status species considered to have potential to occur within a 9-USGS quadrangle map search area that included the *Newhall, California* USGS 7.5-minute topographic quadrangle and the surrounding eight quadrangles (*Whitaker Peak, Warm Springs Mountain, Green Valley, Val Verde, Mint Canyon, Santa Susana, Oat Mountain, and San Fernando*). In addition, the following resources were reviewed for information about the Project Site:

- Aerial photographs (Google Earth Pro 2022)
- *Newhall, California* USGS 7.5-minute topographic quadrangle
- U.S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS) Web Soil Survey
- USFWS Critical Habitat Portal

- USFWS National Wetland Inventory (NWI)
- United States Geological Survey (USGS) National Hydrography Dataset (NHD)

The aforementioned resources are intended to provide a list of special-status species that have been recorded in the region and were accompanied by field assessments performed by qualified biologists, including several focused wildlife and plant surveys performed between 2015 and 2022 in accordance with agency standards. Mitigation Measures MM-BIO-1, MM-BIO-2, and MM-BIO-3 adequately mitigate the Project's potential impact on those species with potential to occur on the Project Site to a less than significant level.

Response to Comment No. O6-10

The comment provides a summary statement that the Draft EIR must be revised to provide accurate baseline information about the Project Site's environmental setting with respect to biological resources to allow for an accurate impact analysis and mitigation plan for the Project. Responses related to the establishment of an accurate baseline for the purposes of evaluating biological resources under CEQA are provided in Response to Comment Nos. O6-7 through O6-9 above. As demonstrated therein, the biological resources assessment identified accurate baseline information about the Project Site's environmental setting, which allowed for an accurate impact analysis and mitigation plan for the Project. The comment presents no new information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-11

The comment states that an EIR must fully disclose all potentially significant impacts of a project and implement all feasible mitigation to reduce those impacts to a less-than-significant level. The comment goes on to discuss the need for supporting documentation and compliance with CEQA requirements in the analysis. The comment then concludes with a statement that courts will not arbitrarily rule on the side of studies presented in a certified EIR. The comment provides background information on CEQA requirements and court actions but does not address the environmental impacts of the Project or the contents of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-12

The comment alleges that the Draft EIR failed to adequately disclose and mitigate the Project's significant air quality impacts, claiming that it improperly applied mitigation measures as PDFs, and, therefore, significant emissions were not reported or sufficiently mitigated. The comment also states that the PDFs were not enforceable as part of the Project as they were not incorporated as mitigation. Response to Comment No. O5-5 details the validity of the use of PDFs with respect to the construction equipment. As detailed in Response to Comment No. O5-5, the PDFs, which specify the use of Tier 3 equipment at a minimum, do not result in a meaningfully different emissions than the application of the default construction equipment fleet in CalEEMod. With or without the PDFs that require a minimum of Tier 3 equipment, Project emissions would be below the South Coast AQMD thresholds of significance and, therefore, less than significant.

Response to Comment No. O6-13

The commenter claims that the Draft EIR failed to adequately address health risk impacts on nearby sensitive receptors by failing to conduct a construction or operational health risk assessment (HRA). Response to Comment No. A3-6 addresses the need for an operational HRA. However, as detailed therein, no operational HRA is warranted.

Similarly, a construction HRA is not necessary based on State and local toxic air contaminant (TAC) regulations and methodologies. The South Coast AQMD's CEQA Handbook[18] does not recommend preparing HRAs to determine the human health risk associated with the construction of land use projects, and the South Coast AQMD has not provided any guidance on how to apply existing health risk guidelines, including the 2015 Office of Environmental Health Hazards Assessment (OEHHA) Risk Assessment Guidelines Guidance Manual, to construction activities.[19]

The South Coast AQMD's rules and guidance with respect to the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (South Coast AQMD Rules and Regulations XIV – Toxics and Other Non-Criteria Pollutants, Rules 1401, and 1402, and OEHHA's guidance manuals), were provided to guide the preparation of HRAs for stationary and certain mobile sources, such as truck movement and idling, ship hoteling at ports, and train idling. This limits the guidance and documents relevant to HRAs and CEQA analysis for non-stationary source land use projects to these specific mobile source land use types. The rules and guidelines promulgated by the South Coast AQMD do not require HRAs to be prepared as part of CEQA documents that evaluate construction and operation of development projects similar to the Project. Additionally, the South Coast AQMD adopted recommendations for the siting of new sensitive land uses near potential sources of air toxics and of siting new sources near sensitive receptors that are similar to those recommended by the California Air Resources Board (CARB) in their Air Quality and Land Use Handbook.[20] CARB's 2005 Handbook recommends siting distances with respect to new sensitive land uses near potential sources of air toxic emissions, such as freeways, distribution centers, rail yards, ports, refineries, chrome plating facilities, dry cleaners, and gasoline dispensing facilities, but does not include construction activities as part of the Handbook sources.

OEHHA, in conjunction with CARB and the California Air Pollution Control Officers Association (CAPCOA), has adopted guidance manuals for use in implementing the Air Toxics Hot Spots Program as part of the Hot Spots Act (California Health and Safety Code Section 44360 et. seq.). The intent of the guidance manuals is to provide HRA procedures for use in the Air Toxics Hot Spots Program or for the permitting of new or modified stationary sources,[21,22] such as industrial-type uses, that emit TACs and are regulated by air districts. Examples of stationary sources include various product manufacturing (e.g., food, chemical, material, etc.), stationary diesel engines (e.g., emergency backup generators), metal finishing/manufacturing, chrome plating facilities, and refineries.[23] The guidance manuals are not meant to be used for a health risk

evaluation of typical non-stationary source land use projects. For these reasons, the Project is not subject to regulation under the Hot Spots Act, the OEHHA 2003 Guidance Manual, or 2015 Guidance Manual.[24,25]

The South Coast AQMD's 10 in 1 million cancer risk threshold and the hazard index threshold of 1 were developed for the emissions of TACs from stationary sources. These thresholds were based on the health risks associated with elevated exposure to TAC compounds from these types of stationary sources. The South Coast AQMD has not identified an appropriate threshold for the assessment of health risk related to construction activities. Further, OEHHA does not include CEQA significance thresholds applicable to construction activities or the operation of non-stationary source projects in their guidance manuals.

The CAPCOA provides lead agencies with guidance of when and how an HRA should be prepared in its guidance document, entitled Health Risk Assessments for Proposed Land Use Projects (CAPCOA HRA Guidance).[26] The CAPCOA HRA Guidance does not provide guidance on how HRAs for construction projects should be addressed in CEQA. It only recommends HRAs related to two types of land use projects—land use projects with toxic emissions impacts and land use projects that would place receptors in the vicinity of existing toxics sources. The Project does not meet either of these criteria as it does not include (1) industrial uses, (2) the use of an unpermitted stationary source, or (3) a residential development. Additionally, the Project would not generate more than 100 heavy-duty truck trips per day or more than 40 truck trips operating transport refrigeration units.[27] This, coupled with the South Coast AQMD not recommending HRAs for construction in any of its CEQA guidance materials, demonstrates why an HRA is not required to be prepared with respect to construction activities.

With regard to the Project's emissions from generators and the resulting potential health risks, as explained in Response to Comment Nos. A3-3 and A3-4, subsequent to the initial analysis, it has been determined that no generators would be included as part of the base Project. Generators, as needed, would be brought on-site by individual productions and would need to be permitted through the South Coast AQMD. As part of the permitting process, the risk associated with the generators would be required to be below regulatory thresholds. See Response to Comment Nos. A3-3, A3-4, and A3-6 for additional information. As demonstrated therein, the Draft EIR adequately disclosed the health risks from exposure to DPM. The comment presents no new information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR.

Response to Comment No. O6-14

The comment claims that the construction noise analysis conclusion of less-than-significant impact is faulty because it relies on the fact that construction noise levels are temporary and would comply with the provisions in the City's Noise Ordinance. The comment explains that a substantial temporary increase in ambient noise is a significant impact and asserts that the Draft EIR's conclusion that construction noise would comply with the City's Noise Ordinance is incorrect

[24] Office of Environmental Health Hazards Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, 2003.
[25] Office of Environmental Health Hazards Assessment, Air toxics Hot Spots Program – Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessment, February 2015.

[27] California Air Resources Board, Air Quality and Land Use Handbook: A Community Health Perspective, April 2005.

because the predicted noise levels would exceed the City's daytime limit of 65 dBA for residential receptors.

The comment asserts that the Draft EIR's noise analysis should have used the daytime 65-dBA limit for residential zones specified in the City's Noise Ordinance (SCMC Section 11.44.040). Section 3.18, Noise, in the City of Santa Clarita One Valley One Vision (General Plan) EIR, explicitly states that construction noise is exempt from the noise limits specified in SCMC Section 11.44.040 if it is performed in accordance with the hours in stated in Section 11.44.080.[28] The summary of SCMC Section 11.44.080 reiterates that construction noise is exempt from Section 11.44.040 and adds that construction noise is exempt also from SCMC Section 11.44.070.[29] In the absence of adopted City noise limits for construction noise, Rincon appropriately utilized the Federal Transit Administration's (FTA) threshold of 80 dBA L_{eq} for an 8-hour period or when construction is conducted outside the allowable hours for construction, as stated in SCMC Section 11.44.080. This FTA threshold is a commonly used threshold in CEQA analyses and is based upon knowledge of an expert federal agency. According to the FTA, "local noise ordinances are typically not very useful in evaluating construction noise. They usually relate to nuisance and hours of allowed activity, and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the impact of a construction project."[30] Therefore, the noise limits in SCMC Section 11.44.040, including the tonal adjustments, would not apply to the construction noise levels generated by the Project. Moreover, although the comment makes reference to 5 dB as clearly discernable and 10 dB as a doubling of sound perceived by most people, the comment does not recommend an increase above ambient noise levels that would be appropriate to use as a threshold.

The comment cites legal cases where courts have invalidated EIRs for relying on improper noise standards and failing to analyze the impacts of noise increases. In the most recent court case, *King & Gardiner Farms, LLC v. County of Kern*, the court does not explicitly require an analysis of an increase over ambient noise. Rather, the court's contention is that the lead agency did not properly support its use of an absolute threshold over the use of an ambient noise increase threshold. There is substantial evidence to support the use of an absolute threshold as the basis of an analysis, as described below:

- This approach is consistent with many jurisdictions within the State, including, as limited examples, the cities of Beverly Hills, Fresno, and Pasadena, and Caltrans, which do not have a threshold for a numeric increase in ambient noise levels.[31]
- Construction hours for the FTA threshold are within the hours permitted by City of Santa Clarita Noise Ordinance. Potential human health impacts from construction noise include hearing loss and sleep disruption; Project construction would avoid sleep disruption by complying with ordinance-allowed hours.

[29] City of Santa Clarita, One Valley One Vision Draft Program EIR, 2010, Section 3.18, Noise, p. 3.18-26. See Footnote 14.
[30] Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018, Section 7.1, p. 179.
[31] City of Beverly Hills Municipal Code Section 5-1-205; City of Fresno Municipal Code Section 10-109; City of Pasadena Municipal Code Chapter 9.36.07; Caltrans Traffic Noise Analysis Protocol Chapter 3.2, April 2022.

- Health impacts during the daytime would include hearing loss, which per OSHA/CalOSHA, can begin to occur 90 dBA L_{eq} (8-hour); the FTA absolute threshold would be well below this limit.[32]
- Noise metrics such as L_{DN} and CNEL support this concept with the penalized hours occurring outside of the allowed construction hours.

Although the increase in ambient noise levels would be noticeable from construction, the absolute threshold approach recognizes the suburban environment of the City and that daytime construction activities can occur (i.e., it is not expected that daytime activities would affect people sleeping). Potential human health impacts (e.g., hearing loss) are addressed by the absolute threshold, which is best for evaluating potential noise impacts during daytime hours over an extended period, as this metric better reflects potential health impacts. Increases in ambient noise levels resulting from construction activities outside of the allowed construction hours in SCMC Section 11.44.080 would be considered significant because sleep disruption would occur during nighttime hours.

As demonstrated above, the Draft EIR used appropriate thresholds to analyze noise impacts from the Project. The comment incorrectly claims that "noise studies that rely on a single measure that excludes possible significant impacts from noise increases or noise extremes do not receive deference by reviewing courts." As demonstrated above, the courts allow for a lead agency to use absolute thresholds with proper support. Accordingly, revisions to the Draft EIR to compare construction noise levels with the noise ordinance's limits for general noise sources and evaluate increased ambient noise levels attributable to Project construction and operation are not warranted.

Response to Comment No. O6-15

The comment claims that the City has failed to analyze the operational noise impacts of the Project using an ambient-based threshold. Regarding an operational ambient noise threshold, the significance of the magnitude of an ambient noise level increase is inherently accounted for by the City's fixed noise limits utilized for the noise analysis in the Draft EIR. The fixed noise limits used in this analysis to evaluate the Project's operational noise are set at reasonable levels at which a substantial noise level increase, as compared to ambient noise levels, would occur. The noise limits used to analyze Project operational noise levels are lower than the FTA threshold discussed above that was used to analyze Project construction noise levels, which accounts for the fact that permanent noise level increases associated with continuous operational noise sources typically result in adverse community reaction at lower magnitudes of increase than temporary noise level increases associated with construction activities that occur during daytime hours and would not affect sleep. In addition, the City's noise limits are lower for nighttime hours to account for the differences in ambient noise levels during daytime hours as compared to nighttime hours. Furthermore, the operational noise thresholds used in the analysis inherently integrate the ambient noise level since the City's noise limits are tailored to specific land uses. The City's operational noise limits are stricter for residential land uses as compared to commercial or industrial land uses because of the typically lower ambient noise levels associated with residential land uses. Therefore, these absolute noise limits account for typical ambient noise levels associated with each land use such that an increase in ambient noise levels that exceeds

[32] OSHA, Standard 1910.95 – Occupation noise exposure.

these limits would be considered a substantial increase above ambient noise levels. Regardless, at the residences to the east of the Project (NM4 and NM4 in Table 4.11 in Section 4.11, Noise, of the Draft EIR), modeled noise levels from 40 dBA to 47 dBA did not exceed the measured ambient noise levels of 47 dBA and 49 dBA in this area. Modeled noise levels of 47 dBA to the north of the Project Site did not exceed an increase of 5 dBA over ambient levels at the residence to the northwest (NM1 in Table 4.11-1). Furthermore, modeled noise levels were below the 35-dBA noise contour and, therefore, well below ambient levels at the residences to the north and northeast (NM2 and NM3 in Table 4.11-1), and modeled noise levels of 44 dBA to the west of the Project Site were well below the measured noise level of 70 dBA (NM5 in Table 4.11-1).

The comment questions the effectiveness of the concrete wall depicted in the Draft EIR, stating that the presence of holes in the wall may reduce its noise reduction capabilities. Regarding the perimeter wall, the Project would install a solid wall. What may appear to be holes in Figure 4.11-3 of the Draft EIR are stylistic indentions of the wall. Therefore, the SoundPLAN model did not overestimate the attenuation from the perimeter wall.

The comment claims that the Draft EIR lacked reference level details used in the SoundPLAN model and a complete narrative of the Project's operational activities and schedule. The Draft EIR provided a summary of operational noise-generating activities, such as arrival and departure of vehicles, limited vehicle idling, vehicle door closing, passenger conversations, and vehicle startup. These activities were included in the parking lot noise levels modeled in SoundPLAN, The parking lot source that was used in SoundPLAN is referred to in the model as "LFU Bayern 2007" with an input type of "visitors and staff." These noise levels are based on an extensive noise study conducted by the Bavarian State Office for the Environment that determined how to calculate noise emissions from parking areas.[33] The Draft EIR also described outdoor areas that would generate noise, including the picnic areas, break areas, patios, food truck areas, and the private park, which are primarily shielded from the adjacent residences by the Project's buildings (e.g., the catering buildings would serve as a buffer between the residences and the private park, and the break areas and patios have been integrated along the buildings' façades facing inward and away from sensitive receptors). The comment does not specify other noise-generating activities that should be described in detail and/or included in the modeling. Exact scheduling details of future operational activities are unknown at this stage of planning; accordingly, the modeling conservatively assumed that mechanical equipment and parking lot activity noise would occur throughout the day and night to reflect the potential for noise levels at all hours.

The comment further states that the reference levels from the cut sheets provided in the Noise and Vibration Study (Appendix J of the Draft EIR) were not used in the SoundPLAN model according to Ms. Toncheva. The specific example cited in the comment is the HVAC unit on page 142 of the Noise and Vibration Study, which would generate a sound pressure level of 77 dBA at 10 feet. The SoundPLAN model includes nine different HVAC units, shown in Table 6 of the Noise and Vibration Study. The spectrum for these units shown in the table were input into the SoundPLAN model; thus, the operational noise contours are reflective of the unit's noise levels using the most accurate noise data provided by the manufacturer. In a 3D noise model, there are additional dynamics, such as attenuation due to the rooftop angles and reflections, that a basic distance attenuation calculation would not convey. It should also be noted that the SoundPLAN

[33] Bayerisches Landesamt für Umwelt, Parking Area Noise, Recommendations for the Calculation of Sound Emissions of Parking Areas, Motorcar Centers and Bus Stations as well as of Multi-Storey Car Parks and Underground Car Parks (6. Revised Edition), 2007.

model conservatively did not include rooftop screening of the HVAC units and, thus, likely overestimated noise levels generated by the HVAC units. In addition, the exhaust noise levels are provided in Table 6 of the Noise and Vibration Study. Given the aforementioned, the assumptions used in the SoundPLAN model were complete.

The comment asserts that a CEQA document cannot rely on "hidden" studies or documents that are not provided to the public, and, therefore, the Draft EIR's conclusions regarding the operational noise impacts of the Project lacked substantial evidence. However, as discussed above, the Draft EIR did not rely on "hidden" studies or documents; substantial evidence was included in the Draft EIR and the Noise and Vibration Study included as Appendix J of the Draft EIR.

Accordingly, as demonstrated above, the comment presents no new information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR. The comment is noted for the record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-16

The comment states that the Draft EIR fails to analyze potentially significant impacts to wildlife, that the analysis of cumulative impacts to wildlife is inadequate, and that the mitigation measures in the Draft EIR are inadequate to address the Project's significant impacts to biological resources. The comment claims that the Draft EIR omits any analysis of impacts on wildlife habitat, such as habitat loss and fragmentation.

Section 4.3, Biological Resources, of the Draft EIR includes a detailed analysis of the Project's potential impact on wildlife and wildlife habitat in accordance with CEQA Guidelines Appendix G, Thresholds 4.3(a), 4.3(b), and 4.3(d). The Project's potential cumulative impact on biological resources is summarized in Subsection 4.3.7 in Section 4.3, Biological Resources. Most of the vegetation on the Project Site is non-native, consisting of non-native wild oat-annual brome grassland, and much of the site has been disturbed by off-highway vehicle trails and other disturbances (e.g., encampments and trash), including within the native vegetation communities. The comment suggests that the Project would contribute further to habitat fragmentation by the loss of one of the region's last patches of undeveloped open space; however, based on review of aerial imagery, the Project Site is isolated and already fragmented from intact native habitats in the region and is surrounded by development.

The comment states that their independent biologist predicts the loss of 1,924 bird nests as a result of the Project's development. This prediction is not supported by any rationale that considers the current state of the Project Site and the condition habitat for nesting birds. For example, the majority of the Project Site consists of low-growing herbaceous vegetation, and few bird species in the region are ground nesters that would nest in this habitat, such as mourning dove (*Zenaida macroura*) and killdeer (*Charadrius vociferus*). Therefore, few bird nests are expected to occur within the non-native grassland areas of the Project Site that would be disturbed. The oak trees and native vegetation on the Project Site provide habitat for nesting birds but are not expansive when considering the amount of area that is covered by native plants/suitable bird nesting habitat. It is expected that birds currently nest within the trees and shrubs that would be disturbed by the Project but not nearly the amount alleged in the comment (estimated by Rincon's professional biologists to be likely less than 5 percent of the 1,924 nests predicted in the comment). The comment suggests that the Draft EIR lacked "any" analysis and

mitigation for loss of nesting bird habitat. Federal and State regulations, including the federal Migratory Bird Treaty Act of 1918 and the California Department of Fish and Game Code, prohibit a project from impacting an active bird nest. Therefore, Mitigation Measure MM-BIO-3 presented in Section 4.3, Biological Resources, of the Draft EIR includes avoidance of bird nests during construction activities. Furthermore, the majority of the native habitat on-site occurs within and along Placerita Creek, which would largely be preserved in place by the Project. Of the 5.39 acres of sensitive natural communities on the Project Site, only 1.392 acres would be permanently impacted, with 0.57 acre temporarily impacted during construction. Mitigation Measure MM-BIO-4 further requires restoration/replacement of this habitat at a minimum 1:1 ratio, thereby further reducing the Project's long-term impacts on habitat and its use by wildlife.

Response to Comment No. O6-17

The comment states that the Draft EIR seemed to analyze whether the Project would interfere substantially with the movement of any wildlife species or with established wildlife corridors but only addressed interference with wildlife corridors and ignored interference with movement of wildlife species. The Project Site represents a relatively small amount of undeveloped space in the vicinity and the region. Not only does most of the Project Site consist of non-native grassland, but it is isolated and already fragmented from intact native habitats in the region and is surrounded by development that limits opportunities for wildlife movement, both locally and regionally. The comment alleges that the Project would cut off such wildlife from one of the last remaining stopover and staging opportunities in the Project area, forcing ever increasing travel between remaining stopover sites. However, this statement is inaccurate, especially when considering the large tracts of open space to the north and east of the Project Site, including the Quigley Canyon Open Space located approximately one mile to the east and the Angeles National Forest just east of SR-14.

Lastly, the comment suggests that the Project could result in traffic-caused wildlife mortality and bird mortality from window collisions. Although the Project would increase vehicle trips, vehicle circulation is generally already high on Railroad Avenue immediately to the west of the Project Site, as well as on Wiley Canyon Road to the north and Lyons Avenue to the south. The Project Site is not within a local or regional wildlife movement corridor, and wildlife are not expected to travel through the Project Site and across Railroad Avenue because of the development that currently exists immediately to the west. Therefore, wildlife collisions along Railroad Avenue immediately to the west of the Project Site are currently low and would be expected to remain low during the operation of the Project due to the vast amount of development that currently exists. In addition, the Project Site is not located within a local or regional bird migration corridor or flyway, and the Project would not introduce significant barriers or windows in the vicinity when considering the vast amount of existing development that is in the immediate vicinity and throughout the City. The scale and type of building construction proposed on site is similar to multiple other commercial and business park developments in the Project vicinity and throughout the Santa Clarita Valley, none of which have resulted in significant bird strike issues. Potential Project impacts to birds due to window collisions would not be significant given the extensive existing development surrounding the Project Site. The incorporation of alternative types of glass or alternative window layouts as suggested in the comment is not necessary to mitigate Project impacts to biological resources; therefore, incorporation of this recommendation in the Draft EIR is not required under CEQA. However, this comment is noted for the administrative record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-18

The comment states that the Draft EIR lacked an adequate analysis of the Project's cumulative impacts on wildlife and references certain sections of the CEQA Guidelines that provide guidance on how to analyze cumulative impacts. However, the comment does not identify any potentially significant cumulative impacts to which the Project could contribute. As analyzed in Subsection 4.7.3 in Section 4.3, Biological Resources, of the Draft EIR, the Project would not cause a considerable contribution to any significant cumulative impacts on biological resources. The discussion in the analysis expressed that impacts on biological resources are typically analyzed on a project-by-project basis, acknowledging that impacts on biological resources are often specific to the Project Site. Nonetheless, the analysis of cumulative impacts on biological resources in Subsection 4.7.3 included a discussion of the potential cumulative impacts of the Project and 36 related projects and concluded that the Project would not considerably contribute to any significant impacts. The comment does not express disagreement with this conclusion or present any evidence to the contrary. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-19

The comment states that the biological resources mitigation measures in the Draft EIR will not reduce the Project's impacts to a level of insignificance. The comment references Mitigation Measures MM-BIO-1, MM-BIO-2, and MM-BIO-3 that are intended to minimize and avoid impacts to special-status wildlife during construction activities. However, the comment states that these mitigation measures would not do anything to prevent further habitat fragmentation, reduce impacts to wildlife caused by Project-generated traffic or window collisions, or lessen the Project's interference with wildlife movement in the region. As indicated in the Response to Comment No. O6-17 above, the Project would not result in significant habitat fragmentation or wildlife mortality caused by Project-generated traffic or window collisions because the Project Site is already fragmented from open space and is surrounded by development. Since such impacts are not significant, no mitigation is required.

The comment indicates that Mitigation Measure MM-BIO-3 incorrectly states the duration of the bird breeding season recognized by CDFW and that pre-construction surveys should be preceded by detection surveys to inform the preconstruction surveys of nesting locations. This comment is based on opinion. The bird nesting season fluctuates based on several factors, such as region, elevation, and seasonal weather conditions. Mitigation Measure MM-BIO-3 indicates that the bird breeding season is generally February 1 to August 31, which is accurate for the region in which the Project is located. Lastly, the comment suggests additional protocol-level detection surveys for burrowing owls, coastal California gnatcatcher, and a suite of special-status species of bats. Protocol surveys for burrowing owl and coastal California gnatcatcher were conducted for the Project, and the results for these species were negative. See the *Burrowing Owl Habitat Assessment and Focused Survey Results for the Blackhall Studios Project, City of Santa Clarita, Los Angeles County, California* dated July 8, 2022, and the *Blackhall Property Project Coastal California Gnatcatcher Focused Survey Report* dated May 26, 2022, both of which were included in Appendix D of the Draft EIR. Moreover, the Project Site does not contain roosting habitat for any bat species.

Response to Comment No. O6-20

The comment claims that the Draft EIR failed to adequately disclose, analyze, and mitigate the Project's transportation impacts and that Mr. Marshall found a number of serious flaws in the VMT analysis.

However, there are several basic flaws in the statements made in the comment and in the attached report by Mr. Marshall. The responses below address the comments in the order as presented in the letter.

The comment claims that the Project's home-based work VMT per employee of 14.0 was compared to an adopted significance threshold of 15.7, and, as a result, the Draft EIR concluded that the Project's VMT impacts were less than significant and required no mitigation. The threshold for the VMT criteria is explained in Appendix C of the Transportation Assessment (Appendix L of the Draft EIR) and again in Footnote [c] of Table 10 in the Transportation Assessment. The threshold of 14.0 work VMT per employee is an interpolation between the citywide threshold of 15.7 for Year 2020 conditions and the projected 11.5 threshold for 2040 conditions. The 14.0 represents the threshold for Year 2028 conditions, which is the Opening Year of the Project. The Draft EIR did not compare the 14.0 work VMT per employee to the 2020 threshold of 15.7 as described in the comment. Table 10 shows that the comparison of 14.0 work VMT per employee calculated for the Project was compared to the calculated 2028 threshold of 14.0 work VMT per employee. Since the Project work VMT per employee does not exceed the threshold work VMT per employee, the Project is found to have no significant VMT impacts, and, therefore, no VMT mitigation is required.

The comment asserts that Mr. Marshall identifies a basic discrepancy in the Draft EIR's analysis that calls into question the VMT modeling results. However, Mr. Marshall's report cited no legitimate flaws in the analysis or conclusions of the VMT analysis and provided no legitimate substantial evidence of a significant VMT impact that requires mitigation. The map showing the location of the Project in a zone that generates above average work VMT per employee generally serves as a guideline that directs further study of individual projects within those various zones. Accordingly, further analysis of the Project's VMT impacts was conducted and included in the Draft EIR. Therefore, there is no inconsistency between the graphic and the analysis results.

The comment claims that Mr. Marshall questions the validity of the Draft EIR's VMT analysis because it was performed using an outdated and unreliable model. The 2016 SCAG model was the model that was used to establish the VMT thresholds in the Santa Clarita area and, therefore, the most logical model to use in the analysis of the Project. The use of this model is consistent with City's *Transportation Analysis Updates in Santa Clarita (TAU)*.

The State CEQA Guidelines for VMT analysis are very careful to point out that when comparing the VMT results of a Project to a threshold target VMT, both the Project analysis and the threshold analysis must be conducted using the same methodology and assumptions in order to have a fair comparison. Consistent with the OPR Technical Advisory, the thresholds of significance established by the TAU are based on the same data used to develop the 2016 SCAG Regional Model. Per the OPR Technical Advisory, in determining potential significant impacts, it is critical to make an "apples-to-apples" comparison between Project-generated VMT and the thresholds of significance. The OPR Technical Advisory states on page 5 that "[m]odels and methodologies used to calculate thresholds, estimate project VMT, and estimate VMT reduction due to mitigation

should be comparable. For example: Where a travel demand model is used to determine thresholds, the same model should also be used to provide trip lengths as part of assessing project VMT." Similarly, the OPR Technical Advisory states on page 30 that "[w]hen using models and tools [for establishing thresholds of significance and estimating VMT reduction attributable to mitigation measures and project alternatives], agencies should use comparable data and methods, in order to set up an 'apples-to-apples' comparison between thresholds, VMT estimates, and VMT mitigation estimates." The City's threshold of significance for work VMT per employee in the City (14.0 work VMT per employee) was established as 15 percent lower than the average work VMT per employee based on the same metrics as used in the model to determine that the Project would generate average work VMT per employee of 14.0. If an alternative data source were to be used to determine Project-related work VMT per employee, it could not be validly compared to the City's established VMT thresholds of significance. The only way a valid comparison could be made would be if that same alternative data methodology were applied to the geographic area of the entire City and used by the City to establish new thresholds of significance. Rather, a key purpose of using the SCAG model is to provide a common basis for both significance thresholds and Project-related VMT analysis, such that localized variations in socio-demographic and built environment factors can be used to compare Project-related VMT to area-wide baseline conditions. Therefore, it is not acceptable to establish the threshold using a regional model and the Project VMT analysis using a methodology based on Census data as described in the comment.

The comment claims that the VMT analysis relied on an outdated model based on data that underestimated commute trip lengths and that it was more accurate to use actual data on commute trips taken from the Census. Mr. Marshall's calculation of 38.7 VMT per worker per day is not consistent with the State's definition of "work VMT per employee". First, work VMT per employee is a one-way trip distance so Mr. Marshall's doubling of his home-to-work distance to get "round trip commutes" automatically gets his estimate to be double what the State threshold calls for. As such, his average of 38.7 VMT per worker per day is not correct, consistent with thresholds established in the TAU, or account for employees that arrive to work via a means other than a single-passenger automobile, such as using transit or carpooling. The work VMT per employee is calculated incorrectly by Mr. Norman by using Census Data and by ignoring carpool passengers and transit/bike/walk trips in his calculation.

The comment claims that the Draft EIR's VMT estimates are inconsistent with the assumptions about Project trip lengths used in the CalEEMod modeling conducted for the Project's GHG impacts analysis. Mr. Marshall points out that the CalEEMod GHG modeling used an average daily traffic level that was 96.3 percent of the daily traffic level used in the Transportation Assessment (7,022 vs. 7,293) but used a home-based work trip length of 16.6 miles (or an inappropriate calculation of 33.2 miles round trip) as compared to a work VMT per employee of 14.0 miles. Again, comparisons are being made incorrectly. The home-to-work distance of 16.6 miles is not the same thing as a work VMT per employee of 14.0 miles because the work VMT per employee includes the consideration of carpools, transit, bike, and walk modes of travel, while the home-to-work distance from the Census Bureau does not. These are not directly comparable numbers and, as such, is inappropriate to suggest otherwise. If both of the daily traffic and the home-to-work numbers were changed in the GHG analyses, the conclusions presented in the Draft EIR would not change. Please see also Response to Comment No. O6-67.

Accordingly, the Draft EIR properly and adequately conducted the Project's VMT analysis. The comment presents no new information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR.

Response to Comment No. O6-21

The comment claims that the Draft EIR failed to adequately disclose, analyze, and mitigate the Project's GHG impacts by not demonstrating compliance with the 2022 Scoping Plan, the SCAG 2020-2045 RTP/SCS, and the City's General Plan. Please refer to Response to Comment Nos. O5-14 through O5-16 for a detailed response to similar comments regarding GHG impacts and the Project's consistency, rather than compliance, with plans.

With respect to the 2022 Scoping Plan, the Draft EIR addressed the Project's compliance with the 2022 Scoping Plan Update in detail on page 4.7-14 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR. As stated therein, the 2022 Scoping Plan strategies that are applicable to the Project include reducing fossil fuel use, energy demand, and VMT; maximizing recycling and diversion from landfills; and increasing water conservation. The Project would reduce fossil fuel usage by providing access to alternative vehicle infrastructure, including constructing a Class I multi-purpose path along the Project frontage on 12th Street, Arch Street, and 13th Street. In addition, the Project would be conditioned to either (1) pay an in-lieu fee to contribute toward improvements or (2) construct a connection to provide a link for pedestrians and bicyclists between the Project Site and the Jan Heidt Newhall Metrolink Station and Old Town Newhall dining and entertainment district. The Class I multi-purpose path would be a completely separate right-of-way for the exclusive use of bicyclists and pedestrians with the path visibly marked. The Project also proposes railroad improvements, including installing a bike path/trail on the north side of the crossing and implementing Americans with Disability Act requirements for pedestrians. These would promote the use of non-fossil fuel vehicles due to the safe, easy access to alternative modes of transportation. Additionally, bus stops for Santa Clarita Transit (SCT) Lines 12 and 757 and Antelope Valley Transit Authority (AVTA) Line 790 are located immediately adjacent to the Project Site. The Jan Heidt Newhall Metrolink Station includes a stop provided for the SCT, Amtrak Thruway Bus, and AVTA services.

The Project would be required to comply with the California Building Standards Code (CCR Title 24), as well as the California Green Building Standards (CALGreen) Code (CCR Title 24, Part 11), which requires implementation of energy-efficient light fixtures and building materials into the design of new construction projects, as well as high efficiency plumbing fixtures. Furthermore, the 2022 Building Energy Efficiency standards (CCR Title 24, Part 6) require newly constructed buildings to meet energy performance standards set by the California Energy Commission. These standards are specifically crafted for new buildings to result in energy efficient performance. Specific to lighting, the Project would implement an energy management system that would energize the lighting fixtures to an "on" condition as desired, and "occupancy type step dimming" would provide for the local control of each fixture. The lighting fixture embedded occupancy sensor would provide an automatic reduction of lighting level output (to approximately 37 percent) if there is no movement in the area and maintain this reduced level of lighting until the sensor detects movement. When this occurs, the lighting level would be increased in 3 seconds to 100 percent until movement is no longer detected and then would maintain this 100-percent level for 5 minutes when the light level would ramp down to 37 percent, which would be maintained until future movement is detected and the process is repeated. This minimizes unnecessary lighting, while maintaining security in the area.

In addition, the Project would, at a minimum, provide parking spaces with EV charging stations and parking spaces that would be EV-ready pursuant to the requirements of the CALGreen Code. Furthermore, subject to City and other agency approvals, rooftop photovoltaic (PV) systems and solar panels would be installed for all the sound stage buildings and the support building for localized use. The exact number of EV stations and amount of solar has not been determined and will be based on the CALGreen Code requirements at the time building permits for the Project are approved. This would reduce GHG emissions as Project employees opt for electric vehicles over gasoline vehicles.

The Project would also implement refuse initiatives for recycling and separation of building materials and site-generated solid waste. These initiatives will include a reduction of waste to the landfill by 57 percent through recycling or reuse efforts.

With respect to the 2020-2045 RTP/SCS, the comment states that the Draft EIR omitted key facts that undermined its conclusions. Specifically, the comment claims that since the Project would provide more parking spaces than employees, it does not discourage the use of single occupancy vehicles and that the Project employment would exceed the projected employment growth for the City.

The Project would result in up to 5,833 employees (approximately 2,333 direct employees, which are those that are employed by the base project, and approximately 3,500 indirect, which are those brought on-site by the individual productions leasing space). Given the potential for over 5,000 employees on-site on any given day, the incorporation of 2,684 vehicle spaces does not provide parking for all potential employees that will access the site and, therefore, will necessitate the use of alternate forms of transportation. The comment claims that the Project's projected employment by itself exceeds the SCAG forecast for all jobs in the City of 1,931 jobs by 2026. The comment only takes into account the job growth within the City and not within the County, which is the measure by which compliance with the 2020-2045 RTP/SCS growth assumptions is determined. Regardless, the comment's reference to job growth of 1,931 by 2026 from Section 4.12, Population and Housing, of the Draft EIR is taken out of context. The Demographic and Growth Forecast technical appendix to the 2020-2045 RTP/SCS only projects employment growth for the year 2045, which as detailed in Section 4.2, Air Quality, on page 4.2-18, is expected to be 14,000 by 2045 in the City of Santa Clarita. Section 4.12, Population and Housing, interpolates annual employment growth in the City to provide contextual information; however, the 2020-2045 RTP/SCS is not based on annual employment growth. The employment of the Project would be approximately 5,833 with only 2,333 of those being direct employees of the base project, which is well below the employment growth of 14,000 anticipated by the 2020-2045 RTP/SCS for the City of Santa Clarita. Therefore, the Project would be consistent with the growth assumed in the RTP/SCS.

Further consistency with the RTP/SCS is detailed in Table 4.10 in Section 4.10, Land Use and Planning, of the Draft EIR, starting on page 4.10-10. Accordingly, the following was added to the discussion of the 2020-2045 RTP/SCS in the second to last sentence of the first full paragraph on page 4.7-15 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR, to include reference to Section 4.10, Land Use and Planning Section, of the Draft EIR, which provided more detail with respect to Project's consistency with the specific policies of the 2020-2045 RTP/SCS (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

> The Project's consistency with the applicable 2020-2045 RTP/SCS strategies is discussed in **Table 4.7-4**, as well as in **Table 4.10-1** in Section 4.10, Land Use and Planning, of this Draft EIR.

In addition, the analysis of the Project's consistency with the policies to support Goal CO 8 of the City's General Plan Conservation and Open Space Element was included in Section 4.10, Land Use and Planning, of the Draft EIR. Furthermore, some of the Project features that would be implemented in compliance with the requirements of Title 24 standards would be more stringent than would be required under the General Plan policies, such energy and water efficiency features.

Based on the discussions provided in Response to Comment Nos. O5-14 through O5-16 and herein, the Project has demonstrated consistency with the 2022 Scoping Plan, the SCAG 2020-2045 RTP/SCS, and the City's General Plan to support its determination of less-than-significant impacts regarding GHG emissions. Accordingly, the Draft EIR properly and adequately analyzed the Project impacts related to GHG emissions. The comment presents no new information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR.

Response to Comment No. O6-22

The comment asserts that the Project improperly relied on "proposed" and unenforceable project design features to mitigate the Project's impacts prior to analyzing and disclosing those impacts. As identified in Response to Comment Nos. O5-5, O5-6, O5-9, O5-10, O5-34, and O6-12 above, PDFs are features of the Project that would be included in the construction and operation of the Project that would be implemented above and beyond compliance with specific regulations and requirements.

Regarding PDFs related to geology and soils, it should be noted that each of the discussions of Project impacts under Thresholds 4.6(a) through 4.6(d) determined that the Project's compliance with the requirements of the National Pollutant Discharge Elimination System Construction General Permit, the California Building Code, the Santa Clarita Building Code, and the requirements for issuance of grading permits, impacts to geology and soils would be less than significant. Implementation of the PDFs would further reduce the less-than-significant impacts related to seismically induced groundshaking and soil stability.

Accordingly, the description and inclusion of PDFs in the Draft EIR is not improper, as alleged by the commenter, but rather aids in fulfilling the required contents of an EIR. CEQA Guidelines Section 15126.4, in particular, expresses that an EIR should discuss "the measures which are proposed by project proponents to be included in the project."

Response to Comment No. O6-23

The comment asserts that the Project improperly relied on project design features to conclude that the Project's energy impacts are less than significant. Please refer to Response to Comment Nos. O5-5, O5-6, O5-9, O5-10, O5-34, and O6-12 and O6-22 above.

Regarding Project Design Feature PDF-GHG-2, prior to the completion of the Draft EIR, the provision of electric vehicle (EV) charging station and EV-ready parking spaces was identified as Project Design Feature PDF-GHG-1 until the City confirmed that the Project would be required to provide such parking spaces pursuant to CALGreen Code requirements; as such, the provision of such parking

spaces was removed as a PDF, and the provision of rooftop solar became Project Design Feature PDF-GHG-1. This oversight has been corrected in the Draft EIR, as presented below.

- The discussion under Subsection 4.5.5, Project Design Features, in Section 4.5, Energy, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  4.5.5 PROJECT DESIGN FEATURES

  No specific Project Design Features are proposed with respect to energy resources. However, Project Design Feature~~s~~ PDF-GHG-1 ~~and PDF-GHG-2~~ in Section 4.7, Greenhouse Gas Emissions, of this Draft EIR would reduce the Project's energy consumption.

- The last sentence in the first full paragraph after Table 4.5-2 on page 4.5-11 in Section 4.5, Energy, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  Moreover, in accordance with Project Design Feature PDF-GHG-1~~2~~, the Project would install rooftop photovoltaic (PV) systems and solar panels for all the sound stage buildings and the support building for localized use, which would exceed California Energy Code standards and reduce the Project's demand on SCE supplies.

- The second to last sentence in the last paragraph on page 4.5-11 in Section 4.5, Energy, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  Furthermore, the Project Site would provide EV charging stations and EV-ready parking spaces pursuant to the requirements of the CALGreen Code ~~Project Design Feature PDF-GHG-1~~, which would reduce fuel usage.

- The second sentence under "***State Energy Regulations***" on page 4.5-12 in Section 4.5, Energy, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  Furthermore, ~~in accordance with PDF-GHG-1 and PDF-GHG-2,~~ the Project ~~Site~~ would provide EV charging stations and EV-ready parking spaces pursuant to the requirements of the CALGreen Code~~,~~ and install rooftop PV systems and solar panels for all the sound stage buildings and the support building for localized use in accordance with Project Design Feature PDF-GHG-1.

Whether the provision of EV charging stations and EV-ready parking spaces was presented as a PDF or code requirement, their provision would contribute to the reduction in the Project's energy consumption. These changes do not result in the Project creating any new or increased significant environmental impact that is not already identified in the Draft EIR and do not otherwise change the Draft EIR's analysis of impacts related to energy.

Section 4.7, Greenhouse Gas Emissions, of the Draft EIR, correctly identified the installation of rooftop photovoltaic (PV) systems and solar panels as Project Design Feature PDF-GHG-1. It should be noted that this PDF was conservatively not included in the quantification of estimated annual operational emissions presented in Table 4.7-2 on page 4.7-13 of the Draft EIR. However,

the provision of rooftop PV systems and solar panels was taken into account in the analysis of the Project's consistency with the 2022 Scoping Plan and 2020-2045 RTP/SCS in Subsection 4.7.6, Analysis of Project Impacts, in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR.

Response to Comment No. O6-24

The comment asserts that the Project improperly relied on project design features to conclude that the Project's impacts to public services involving the Los Angeles County Fire Department (LACoFD) and Los Angeles County Sheriff's Department (LASD) are less than significant. Please refer to Response to Comment Nos. O5-5, O5-6, O5-9, O5-10, O5-34, and O6-12 and O6-22 above.

In addition, Project Design Feature PDF-PUB-1 addresses LACoFD's comment in response to the Notice of Preparation (NOP) and simply incorporated LACoFD's response in the Project design and, therefore, is not a mitigation measure. Similarly, LASD's comment in response to the NOP recommended incorporation of the principles of Crime Prevention through Environmental Design (CPTED) in the design plans. As stated by LASD in the NOP response letter, the "goal of CPTED is to reduce opportunities for criminal activities by employing physical design features that discourage anti-social behavior, while encouraging the legitimate use of the site. The overall tenets of CPTED include defensible space, territoriality, surveillance, lighting, landscaping, and physical security. The Station recommends installation of security cameras to reduce opportunities for criminal activities." Accordingly, Project Design Features PDF-PUB-2 through PDF-PUB-4 simply incorporated LASD's CPTED recommendation in the Project design and, therefore, are not mitigation measures. As such, the description and inclusion of PDFs in the Draft EIR are not improper, as alleged in the comment, but rather aid in fulfilling the required contents of an EIR. CEQA Guidelines Section 15126.4, in particular, expresses that an EIR should discuss "the measures which are proposed by project proponents to be included in the project."

Response to Comment No. O6-25

The comment asserts that the Project improperly used project design features to conclude that the Project's impacts related to wildfire are less than significant. Please refer to Response to Comment Nos. O5-5, O5-6, O5-9, O5-10, O5-34, and O6-12 and O6-22 above.

In addition, the project design features identified in Section 4.17, Wildfire, of the Draft EIR were not used as the basis for determining the level of significance of impacts related to wildfire. More specifically, the impact analysis as to whether the Project would substantially impair an adopted emergency response plan or emergency evacuation plan was based on the results of the traffic evacuation assessment prepared for the Project, which determined that the proposed roadway modifications implemented by the Project would reduce the existing average travel time through the Dockweiler Corridor, and that the City's existing emergency response system, as established in the City's Hazard Management Plan, would be sufficient to address emergency evacuation scenarios in the event of natural or man-made incidents in the Project area that result in a need to evacuate some or all existing residents of the adjacent communities and future Project employees. Project Design Feature PDF-WF-3 simply identified implementation of a Wildfire Education Program to establish an evacuation plan specifically for the Project Site. Similarly, the impact analysis as to whether the Project would expose Project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire or exacerbate fire risk or that may result in temporary or ongoing impacts to the environment was based on the modeling scenarios studied to determine fire behavior on the Project Site under existing and post-

development conditions. The modeling results showed that fire potential on the Project Site would be lower than existing conditions due to fire safety requirements, to which the Project would comply. The fire risk assessment of the Project area also determined that with "the conversion of the existing landscape to ignition-resistant development, wildfires may still encroach upon and drop embers on the site but would not be expected to burn through the site or produce sustainable spot fires due to the lack of available fuels." The fire risk assessment also concluded that the Project "would not facilitate wildfire spread and would reduce projected flame lengths to levels that would be manageable by firefighting resources for protecting the site's structure, especially given the ignition resistance of the structures and the planned ongoing maintenance of the entire site landscape." Project Design Features PDF-WF-1 through PDF-WL-4 simply specify the primary provisions of the Project's Fire Protection Plan and are fire protection features that would be implemented by the Project that are above and beyond code requirements. Accordingly, the description and inclusion of PDFs in the Draft EIR are not improper, as alleged in the comment, but rather aid in fulfilling the required contents of an EIR. CEQA Guidelines Section 15126.4, in particular, expresses that an EIR should discuss "the measures which are proposed by project proponents to be included in the project."

Response to Comment No. O6-26

The comment asserts that the Draft EIR is wholly inadequate under CEQA and that it must be revised and recirculated. However, as discussed in the responses above, the Draft EIR fully complies with all requirements of CEQA and the CEQA Guidelines. The comment presents no other information or substantial evidence about other any specific impact area that would require substantial changes to the Draft EIR or present any information that meets any of the criteria for recirculation of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-27

The comment provides an introduction to Clark and Associates (Clark) and Clark's review of the materials contained in the Draft EIR. The comment restates the description of the Project. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-28

The comment asserts that the Draft EIR concluded that no mitigation is required to prevent impacts from the Project on air quality in the area and that this conclusion is in conflict with the facts provided within the Draft EIR. There are no specifics identified in this comment to identify what is in conflict. Section 4.2, Air Quality, of the Draft EIR, provided a comprehensive analysis of the Project's potential impacts on air quality and concluded that such impacts are less than significant. The lead agency is unaware of any conflicts between the facts and conclusions presented in the EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-29

The comment alleges that the City failed to perform a quantitative HRA of the impacts of toxic air contaminants emissions from construction of the Project on the nearest sensitive receptors. The comment also provides analysis that contends that the operation of emergency generators would contribute to a substantial health risk to nearby residents. This comment is an expanded version of Comment No. O6-13 above; accordingly, please see Response to Comment No. O6-13 above.

A health risk analysis for operation of the generators is not required as part of the EIR as generators would not be included as part of the base Project. While generators may be brought on-site by individual productions leasing space, those productions would be required to obtain South Coast AQMD permits for such generators, and health risks assessments will be required. As part of the permitting process, the risk associated with the generators would be below the regulatory threshold of 10 in one million in order to receive a permit to operate. Therefore, operation of generators will be regulated to less-than-significant levels.

Response to Comment No. O6-30

The comment claims that the Project failed to require the use of Tier 4 Final technology for off-road diesel equipment. Table 4.2-5 on page 4.2-20 in Section 4.2, Air Quality, of the Draft EIR, presented regional emissions that are below regulatory thresholds with the use of Tier 3 engines. Additionally, Table 4.2-7 on page 4.2-21 showed that localized impacts are below regulatory thresholds with the incorporation of Tier 3 engines. CEQA does not require a project to mitigate to the fullest extent possible but only to mitigate those impacts that are found to be significant without additional reductions. Given the less-than-significant impacts associated with all air quality impacts, there is no need to mitigate and incorporate Tier 4 construction equipment. There is a typographical error in the CalEEMod notations that suggests Tier 4 as a PDF. However, as identified in the Draft EIR, Project Design Features PDF-AQ-1 and PDF-AQ-2 indicated that Tier 3 offroad emissions standards would be used and that Tier 3 equipment was accurately modeled in CalEEMod as shown in the comment. To remove confusion, the typographical error in the CalEEMod notations has been corrected. The following revision was made to the 12th line item/adjustment factors on page 2 of 36 in the CalEEMod Output in Appendix A of the Air Quality and Greenhouse Gas Emissions Study (included in Appendix C of the Draft EIR), as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

> Construction Off-road Equipment Mitigation – SCAQMD Rule 403, watering and vehicle speed from Table 1 BACT applicable to all construction activity. Based on applicant information, the construction fleet > 50 HP would be equipped with Tier ~~4~~ 3 engines and level 3 DPF filters

This change does not result in the Project creating any new or increased significant environmental impact that was not already identified in the Draft EIR or meet any of the criteria for recirculation of the Draft EIR.

Response to Comment No. O6-31

The comment claims that the Draft EIR failed to identify all of the sensitive receptors within an 0.25-mile radius of the Project Site. The Draft EIR identified the sensitive receptors within 1,000 feet of the Project Site, which is typical of air quality analysis as pollution and, therefore, impacts dissipate as the distance from the source increases. The comment identified two schools located at 0.3 mile from the Project Site. These schools would be greater than 0.25-mile distance from the Project Site, and, therefore, even by the comment's definition of exclusion zone would not need to be identified. Additionally, at 0.3 mile, individuals at the schools would be subject to less impacts from emissions than those residents closer to the Project Site. Furthermore, using the concentration map from Comment No. O6-29, the schools would be predominantly upwind from the Project Site; as students/staff remain at the schools for less time than the residents located closer to the Project Site, they would be exposed to less pollutants from on-site activities than the adjacent residences.

Therefore, while the schools do not need to be identified in the analysis, if they were, impacts would be less than those identified for the residences that are closer to the Project Site, which the Draft EIR determined are less than significant. Accordingly, the Draft EIR properly and adequately analyzed Project impacts to sensitive receptors within an 0.25-mile radius of the Project Site. As such, no changes to the Draft EIR are necessary based on this comment.

Response to Comment No. O6-32

The comment claims that the analysis of operational emissions in the Draft EIR is incomplete because it failed to include emissions from the fire pump system that would be installed on-site. The Project description does not include a fire pump system as included in the Project. The analysis was conducted based on the description of the Project that was available at the time of analysis, and it has been subsequently confirmed that a fire pump would not be necessary for the Project. Accordingly, the Draft EIR properly and adequately analyzed the Project's operational emissions. As such, no changes to the Draft EIR are necessary based on this comment.

Response to Comment No. O6-33

The comment claims that the emissions reductions provided by the EV charging station calculations do not make sense. The emissions reductions from the EV charging stations take into account VMT reductions based on the potential of 10 hours of operating time per charger and assumes a charge of 25 miles per hour. The analysis also assumes that a single vehicle would not stay at the station all day and includes the State's move toward substantially increasing the EV fleet for private vehicles between now and 2045. The analysis includes the lead agency's best assumptions at energy reduction for the Project due to the inclusion of EV charging stations based on the known Project activities and current industry standards. Regardless, the finding of a less-than-significant impact is based on the Project's consistency with local and State plans and policies for the reduction of GHG emissions and is not based on reaching a specific numeric target of Project emissions. In addition, while the comment claims that the math does not make sense, the comment does not provide any supporting documentation to refute the information provided in the analysis. Therefore, even if the reduction of GHG emissions from EV charging stations were removed from the GHG analysis and the Project identified emissions were accordingly increased from 7,252 MTCO2e to 10,610 MTCO2e, the Project's GHG impacts would still be less than significant because the Project would remain consistent with all of the GHG reduction plans and policies as identified in the Draft EIR. Accordingly, the Draft EIR properly and adequately analyzed the Project's GHG impacts. As such, no changes to the Draft EIR are necessary based on this comment.

Response to Comment No. O6-34

The comment claims that the facts identified and referenced in the comment letter lead to a conclusion that the Project could result in significant impacts and that the Draft EIR should be revised. There are no facts identified in this comment to support this statement as this is a conclusionary statement to summarize the issues identified in the letter. The issues are addressed in Response to Comment Nos. O6-29 through O6-33 above. No further direct response is required for this comment.

Response to Comment No. O6-35

This introductory comment summarizes the Project description and briefly describes Wilson Ihrig, the acoustical consultant, commenting on the Draft EIR noise analysis. The comment does not

address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-36

The comment provides a summary of the health effects of noise. The comment also states that "the health effects of noise are not taken as seriously in the United States as they are in other countries," although this comment is not substantiated. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O6-37

The comment implies that the Draft EIR incorrectly described the Project's construction noise impacts as temporary and references SCMC Chapter 17.67, which addresses temporary uses that last less than one year, such as circuses, carnivals, rodeos, parades, and Christmas tree sales. The use of this chapter of the SCMC is not applicable since it is not related to construction activities. The word "temporary" is subjective and is not beholden to one year or less, as its meaning is essentially "not permanent," which aptly describes a two-year construction period. Agencies, such as Caltrans, describe construction activities as "temporary" in their guidance in statements, such as "although construction activities potentially generate the highest vibration levels and most damage, they are temporary in nature."[34] Caltrans guidance also states that "residents' tolerance toward construction noise is greatly increased if they are informed that the noise is temporary."[35] Therefore, expert State agencies agree that construction noise levels are more tolerable because construction activities are temporary, and the Draft EIR's conclusion in this regard is appropriate.

The comment claims that Draft EIR incorrectly applied an 80-dBA noise threshold based on FTA Transit Noise and Vibration Assessment Criteria, instead of using the noise limits prescribed in the City's Noise Ordinance, and claims that the City's 65-dBA daytime limit in residential zones should apply to Project construction. The comment cites the Draft EIR's predicted 70-dBA construction noise levels and emphasizes that the predicted noise levels would not comply with the City's Noise Ordinance. In addition, the comment suggests that the Project should consider an ambient-based threshold in addition to the City's 65-dBA noise limit to evaluate construction noise impacts. See Response to Comment No. O6-14 for a discussion of the Draft EIR's appropriate use of the FTA threshold in lieu of the City's 65 dBA daytime noise limit and/or an ambient-based threshold.

Regarding the comment about noise measurements including any rail activity, train activity was measured for the first 15 seconds of NM3; as seen in the raw measurement data included in the Noise and Vibration Study, the noise levels from rail at this distance were consistent with ambient noise during the rest of the measurement. No trains were observed during the measurement of NM5; this measurement and the other measurements represent conservative ambient noise levels as they did not capture train activity. Regardless, modeled noise levels at the residences in this area were 44 dBA L_{eq}, which is lower than even the minimum noise level measured at NM5 of 48.9 dBA L_{min}.

[34] California Department of Transportation, Technical Noise Supplement, 2013, p. 7-28.
[35] California Department of Transportation, Technical Noise Supplement, 2013, p. 7-27.

Furthermore, the comment models all construction equipment included in the Draft EIR's air quality report (Appendix C of the Draft EIR) simultaneously at a distance of 200 feet to develop an 83-dBA L_{eq} noise level at the nearest sensitive receptors. Simultaneous operation of eight pieces of construction equipment within close distance is not a realistic construction scenario; while such pieces of equipment may be on the full 93-acre Project Site, equipment use is typically operated in groups of two or three on different parts of the site. FTA guidance recommends the use of a distance variable that "assume[s] that all equipment operates at the center of the project" in the construction noise calculation when modeling all construction equipment in one phase.[36] Applying this FTA guidance to Project's noise modeling would result in a distance of approximately 500 feet to the nearest sensitive receptors, which is a more fair distance metric to use if modeling all eight construction equipment forecasted to operate on the 93-acre Project Site. At 500 feet, the construction equipment would result in a noise level of 68 dBA L_{eq} (8-hour), well below the FTA's 80-dBA L_{eq} (8-hour) threshold. See Response to Comment No. O6-14 for a discussion of the validity of the 80-dBA FTA threshold.

It should also be noted that the construction noise levels provided in Table 1 of the comment letter appear to be overestimated. The table lists a "tractor/loader/backhoe" as a row of Project construction equipment, as this is how CalEEMod lists these pieces of equipment in one grouping. In other words, if a project has one tractor and one loader, it will appear in CalEEMod as two equipment under "tractor/loader/backhoe." The comment appears to have assumed this meant two tractors, two loaders, and two backhoes, which is incorrect and erroneously estimated a noise level of 73 dBA at 200 feet from these pieces of equipment. These types of equipment are separate in the Roadway Construction Noise Model (RCNM) and have different noise levels. Assuming two tractors (the loudest of the three), noise levels from that equipment would be 71 dBA at 200 feet. Further, in the last paragraph before Table 1, the comment references the grading noise level as 77 dBA at 200 feet and the noise level at 105 feet as 83 dBA, yet in the bolded row in Table 1 under the "Construction Leq at 200 feet, dBA" column, the table lists the value at 200 feet as 83 dBA. Even if we incorrectly assume two tractors, two loaders, and two backhoes under grading, the sum of all the construction equipment for this phase at 200 feet would be 77 dBA. Therefore, Table 1 is misleading and/or incorrect.

Response to Comment No. O6-38

The comment states that the Project should consider an ambient-based threshold in addition to the City's Ordinance criteria to assess the impact of operational noise. The comment claims that the Draft EIR lacks details about the reference levels used in the SoundPLAN model and a narrative of the noise-generating operational activities and schedule. The comment also questions the effectiveness of the concrete wall depicted in the Draft EIR, stating that the presence of holes in the wall may reduce its noise reduction capabilities. See Response to Comment No. O6-15, which explains why the use of an operational ambient noise threshold is unnecessary, discusses the operational noise reference levels used in the SoundPLAN model for the Project's noise modeling, and addresses the effectiveness of the perimeter wall, which does not include holes.

The comment further states that the analysis in the Draft EIR did not address issues, such as truck idling, auxiliary noise sources such as generators, loud speech from shoot coordination, or parking lot activity at night in the MWD lot located directly adjacent to the residences east of the Project Site on Alderbrook Drive. The excess truck and trailer parking and base camp are

[36] Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018.

accounted for by the parking lot modeling in the SoundPLAN model, which includes typical vehicle activity associated with parking lot activities, including engine idling. The comment's concern over loud speech from shoot coordination is not expected to occur since outdoor stages and/or sets are not a part of the Project; all sets would be located indoors. Only incidental outdoor filming is anticipated. Regarding auxiliary noise sources and nighttime parking lot activity, the model does include mechanical equipment and parking lot noise occurring during nighttime hours. Table 4.11-3 in Section 4.11, Noise, of the Draft EIR, showed the modeled noise levels at OFF1 through OFF8, which represent the residences along Alderbrook Drive would not exceed the nighttime noise limits.

Lastly, the comment questions whether the reference levels from the equipment cut sheets provided in the Noise and Vibration Study (Appendix J of the Draft EIR) were considered in the SoundPLAN model. See Response to Comment No. O6-15, which explains the reference levels used in the SoundPLAN model.

Response to Comment No. O6-39

This conclusory comment summarizes the concerns regarding the adequacy of the Draft EIR's noise analysis. Please see Response to Comment Nos. O6-37 and O6-38. As stated in those responses, the conclusions of the Draft EIR for construction and operational noise impacts are valid and supported by substantial evidence. This comment is noted for the administrative record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-40

The comment states their qualifications as a biologist for providing comments on the Draft EIR and biological resources report. The comment also introduces and states the qualifications for wildlife biologist Noriko Smallwood, describes the weather and vegetation observed by Ms. Smallwood during the site visit conducted on May 14, 2023, and provides photographs and a table listing the wildlife observed during the site visit. According to Ms. Smallwood, 40 species of vertebrate wildlife were observed on the Project Site during a 3.52-hour survey. Ms. Smallwood's survey results are noted for the administrative record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-41

The comment states that a reconnaissance-level survey should serve only as a starting point toward characterization of a site's wildlife community, but it cannot alone provide an inventory of species that use the site and asserts that a much greater survey effort is needed at the site in order to characterize the existing environmental setting with sufficient accuracy to support a sound impacts analysis. To support this assertion, the comment cites data from past surveys to demonstrate that more time spent on or repeat surveys result in more species detected. The presented data are noted for the record and will be forwarded to the decision-makers for review and consideration.

The reconnaissance survey conducted by Rincon was not intended to be a comprehensive inventory of all species that inhabit the Project Site, and it is not represented as such in the Rincon Biological Resources Assessment (BRA). A comprehensive biological inventory of the Project Site is not necessary to support a sound impacts analysis because professional biologists are able to make inferences about the potential for special-status wildlife to occur based upon known ranges, habitat preferences for the species, species occurrence records from scientific database

queries, previous reports for the Project Site, and the results of surveys of the Project Site. Based on the results of the initial habitat assessment, focused surveys were performed for specific special-status species determined to have the potential to occur based on the distribution and quality of the vegetation and associated habitats on the Project Site, such as for western burrowing owl and coastal California gnatcatcher. As such, additional repeat or focused surveys are not necessary.

Response to Comment No. O6-42

The comment states that the Draft EIR's surveys of the Project Site for biological resources and reviews of literature, databases, and local experts for documented occurrences of special-status species are incomplete and misleading and that survey limitations should be disclosed. The comment does not specify why the information provided in the Draft EIR is incomplete or misleading, and the comment's claim is not supported by substantial evidence. As stated in the BRA prepared for the Project, surveys were conducted in accordance with applicable USFWS and CDFW guidelines and requirements. Literature review consisted of queries of the USFWS Information, Planning and Conservation System, CDFW California Natural Diversity Database (CNDDB), and the California Native Plant Society Online Inventory of Rare, Threatened and Endangered Plants of California. Furthermore, the BRA stated that the biological reconnaissance survey was limited by the environmental conditions present at the time of the survey. As noted in Response to Comment Nos. A1-9 and O6-41, additional focused surveys for SSC species are not necessary to reduce Project impacts to a less-than-significant level.

Response to Comment No. O6-43

The comment states that the Rincon's statement in the BRA that "all biological resources encountered on-site were recorded" is false and misleading because no biologist is capable of recognizing all evidence of wildlife. The comment recommends that the Draft EIR be revised to more carefully report what was seen and understood by the biologists. In addition, the Draft EIR should describe the limitations of the surveys and the reporting of survey outcomes.

As discussed above in Response to Comment No. O6-42, the BRA disclosed the limitations of the biological reconnaissance survey. The last sentence under "**FIELD RECONNAISSANCE SURVEY**" on page 4.3-16 in Section 4.3, Biological Resources, of the Draft EIR was revised to state that all vertebrate wildlife species observed were documented, as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

> Representative photographs of the Project Site were taken and an inventory of all plant and vertebrate wildlife species observed was compiled (provided in Appendix **D**).

Response to Comment No. O6-44

The comment states that the duration of the reconnaissance survey is unreported and that Rincon's biologists should have seen more species of wildlife. This comment is similar to Comment No. O6-7. Please refer to Response to Comment No. O6-7 above.

Response to Comment No. O6-45

The comment states that the number of species detected on-site is greater than the number of species Rincon reported. The comment also claims that Rincon's survey effort was deficient and states that the Draft EIR needs to be revised with the outcomes of more surveys and more

complete reporting to include the total number of species detected and not just the species detected during the reconnaissance survey. Please see Response to Comment No. O6-41 regarding the sufficiency of the reconnaissance survey effort to evaluate existing conditions and potential Project impacts to sensitive biological resources.

The comment also states that USFWS Birds of Conservation Concern (BCC) are special status and should be reported as such. Birds of Conservation Concern are a USFWS effort to identify non-listed birds that might become candidates for listing in the future. The Draft EIR evaluated USFWS-listed or candidate species but did not consider species that might become candidates for listing in the future. This is a reasonable approach. The City understands that there is a long list of plants and animals – not just birds – that might experience increased pressure in the future and that might become candidates for listing or, subsequently, become listed species. The Draft EIR presented an appropriately broad reach to include candidate species, as well as listed species and is not required to include potential candidates. However, birds not specifically identified as listed or candidate species were not excluded from consideration in the Draft EIR, which recognized the importance of the federal Migratory Bird Treaty Act as an applicable law and prescribes Mitigation Measure MM-BIO-3 that requires specific actions to protect nesting birds from construction impacts.

Response to Comment No. O6-46

The comment asserts that Rincon's statement that an individual Cooper's hawk was observed during the January 2022 reconnaissance survey, but a nest was not observed is misleading because it gives the false impression that the failure to observe a nest in January would indicate the species is not nesting on the Project Site. The comment also states that the same false impression was conveyed by the observation of a single, inactive passerine nest during the reconnaissance survey, implying that nesting is not taking place.

The comment's assertion that the Draft EIR is misleading regarding Cooper's hawk and nesting birds is inaccurate. The Draft EIR acknowledged that the potential for Cooper's hawk and nesting birds to be present within the Project Site is high and stated the following on page 4.3-18 in Section 4.3, Biological Resources, of the Draft EIR:

> *As potentially suitable habitat for these special-status wildlife species exists on the Project Site, implementation of the Project would potentially impact existing habitat. Construction of the Project would potentially result in direct impacts during initial ground-disturbing activities or indirect adverse impacts to special-status wildlife species if present. Construction activities have the potential to directly impact nesting birds through the destruction of nests or disturbances leading to nest failure. As such, impacts to special-status wildlife species (i.e., nesting birds) that exist on the Project Site or the areas immediately surrounding the Project Site would be potentially significant.*

The Draft EIR included Mitigation Measures MM-BIO-1 through MM-BIO-3 to reduce impacts to special-status wildlife species and nesting birds to a less-than-significant level.

Response to Comment No. O6-47

The comment states that the yellow warbler observed on-site in April 2022 relied on the Project Site for its migration to breeding habitat or may have been nesting on-site and that, contrary to Rincon's assessment, the Project Site provides important habitat value to yellow warbler.

Required habitat elements for yellow warbler nesting, such as riparian thickets of willow, cottonwoods, sycamores, ash, and alders, are not present within the Project Site. Not only does most of the Project Site consist of non-native grassland, but it is isolated and already fragmented from intact native habitats in the region and is surrounded by development that limits opportunities for wildlife movement, both locally and regionally. The large tracts of open space to the north and east of the Project Site, including the Quigley Canyon Open Space located approximately one mile to the east and the Angeles National Forest just east of the SR-14, contain suitable riparian habitat for yellow warbler and are far more likely to provide important nesting and migratory habitat value to the species.

Response to Comment No. O6-48

The comment states that non-breeding surveys for coastal California gnatcatcher were not completed for the Project Site. The comment also states that the burrowing owl surveys were not compliant with the available survey protocol by failing to meet 16 of the 34 applicable minimum standards and only partly complying with another four of the standards. The comment recommends that the burrowing owl surveys be repeated in accordance with the survey and reporting standards and that they should be completed by qualified biologists. This comment is similar to Comment No. O6-8. Please refer to Response to Comment No. O6-8 above.

Response to Comment No. O6-49

The comment states that an important part of documenting a site's environmental setting is a desktop review, which includes literature and database review and consultation with local experts to inform and augment reconnaissance surveys and to help determine which protocol-level detection surveys should be conducted. The commenter suggests that the Draft EIR's desktop review is incomplete and flawed because it neglected readily available species occurrence databases and provides no evidence that any local experts were consulted. The commenter indicates that Dr. Smallwood conducted an independent database review and a Project Site visit, which resulted in the identification of 122 special status wildlife species occurring near enough to the Project Site to warrant analysis of their occurrence potential. This comment is substantially similar to Comment No. O6-9. Please refer to Response to Comment No. O6-9 above.

The comment reiterates the assertion that detection likelihoods of most special-status species are low during reconnaissance-level survey and maintains that additional surveys are needed. Please refer to Response to Comment No. O6-41, which explains why additional surveys are not necessary.

Response to Comment No. O6-50

The comment states that it is inappropriate to assign low likelihoods of occurrence to special-status species of wildlife simply because the biologist did not detect the species during a single reconnaissance survey.

The Rincon BRA did not exclude the potential for special-status wildlife species to occur based on failure to detect the species during the reconnaissance survey. As described in Response to Comment No. O6-41, additional factors were considered, such as availability and quality of habitat to support the species, known ranges, species occurrence records from scientific database queries, previous reports for the Project Site, and the results of surveys of the Project Site.

Response to Comment No. O6-51

The comment states that more special-status species occur at the Project Site than those that were identified in the Draft EIR and by Rincon and that the Draft EIR incorrectly characterized the wildlife community at the Project Site. The comment also suggests that additional surveys would result in the detection of more species. These issues have been addressed in Response to Comment Nos. O6-7, O6-9, and O6-41. Response to Comment No. O6-7 and O6-9 explain the discrepancies between the species detected by Ms. Smallwood and those that were reported by Rincon. Response to Comment No. O6-41 explains why additional surveys are not necessary.

Response to Comment No. O6-52

The comment claims that there are three types of impacts that are likely to result from the Project, two of which are not analyzed in the Draft EIR. According to the comment, the one impact that is addressed in the Draft EIR is only mentioned and concluded to be of no significance. The comment correctly cites the Draft EIR's characterization of the Project Site as a relatively flat, undeveloped piece of land with low, ruderal plants and gravel driveways that has been cleared of the majority of its natural vegetation and disturbed by past uses. The presence of 16 coast live oak and valley oak trees within the context of the largely disturbed Project Site is also accurately cited. The comment provides no specifics on the three types of impact. As such, this comment is noted, and no additional response is required.

Response to Comment No. O6-53

The comment states that the Draft EIR failed to analyze the Project Site's capacity to support wildlife and estimates the loss of 1,924 bird nests as a result of the Project's development. The comment states that the Draft EIR must be revised to analyze the Project's impacts to wildlife caused by habitat loss and habitat fragmentation. This comment is similar to Comment No. O6-16 but cites studies from 1948 and 1982 to support the bird nesting densities and calculations summarized in Comment No. O6-16. Please refer to Response to Comment No. O6-16 above.

Response to Comment No. O6-54

The comment states that the Draft EIR purported to analyze whether the Project would interfere substantially with the movement of any wildlife species or with established wildlife corridors but only addresses interference with wildlife corridors and ignores interference with movement of wildlife species. This comment is similar to Comment No. O6-17. Please refer to Response to Comment No. O6-17 above.

Response to Comment No. O6-55

The comment states that Project-generated traffic impacts to wildlife would be substantial and highly significant, based on the extrapolation of a wildlife fatality study conducted on Vasco Road in Contra Costa County, California[37] with the Project's estimated annual VMT. The comment goes on to state that the Project would result in a substantial and highly significant number of traffic-related wildlife fatalities.

[37] M. Mendelsohn, W. Dexter, E. Olson, and S. Weber, Vasco Road wildlife movement study report. Report to Contra Costa County Public Works Department, Martinez, California, 2009.

While the study that the comment cites is not publicly available, Vasco Road is a two-lane road that bisects relatively undeveloped open spaces. Accordingly, the comment's estimated number of traffic-related wildlife fatalities that may result from Project development is not accurate when considering the existing high vehicle circulation on Railroad Avenue immediately to the west of the Project Site, as well as on Wiley Canyon Road to the north and Lyons Avenue to the south. The Project Site is not within a local or regional wildlife movement corridor and wildlife are not expected to travel through the Project Site and across Railroad Avenue due to the development that currently exists immediately to the west. Therefore, wildlife collisions along Railroad Avenue immediately to the west of the Project Site are currently low and would be expected to remain low during the operation of the Project due to the vast amount of development that currently exists.

Response to Comment No. O6-56

The comment states that the Project could result in bird mortality from window collisions, and recommends exploration of alternative window layouts or alternative types of glass to minimize bird-window collisions. The comment cites numerous bird fatality and collision studies, which provide fatality estimates to support the claim. These estimates are noted in the administrative record and will be forwarded to the decision-makers for review and consideration.

Please refer to Response to Comment No. O6-17, which concludes that potential Project impacts to birds due to window collisions would not be significant given the extensive existing development surrounding the Project Site. The comment's recommendations for the use of alternative types of glass or alternative window layouts is not necessary to mitigate Project impacts to biological resources; however, these recommendations are noted in the administrative record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-57

The comment states that the Draft EIR lacked an adequate analysis of the Project's cumulative impacts on wildlife, references certain sections of the CEQA Guidelines that provide guidance on how to analyze cumulative impacts, and provides commentary on approaches to evaluating cumulative impacts. However, the comment does not identify any significant cumulative impacts that would be caused by the Project or that the Project would contribute to in a considerable manner. As discussed in the Draft EIR, the loss of habitat caused by the Project is not a significant impact either on a Project-level or cumulative. The majority of the Project Site is covered in non-native grasses. The habitat areas of the Project Site, including Placerita Creek and the northern ridgeline would be largely preserved in place. Given the limited acreage of habitat impacts of the Project and the vast tracks of protected open spaces in the Project vicinity (e.g., Quigley Canyon Open Space, Whitney Canyon Park, Golden Valley Ranch Open Space, Saddletree Open Space, Gates King Open Space, Wildwood Canyon Open Space, and the Angeles National Forest), the Project's contributions to the cumulative loss of open space and potential habitat would not be cumulatively considerable. Please also refer to Response to Comment No. O6-18 above.

Response to Comment No. O6-58

The comment states that Mitigation Measures MM-BIO-1 through MM-BIO-5 would not reduce impacts related to the productive capacity of breeding birds and special-status species that make use of the Project Site, habitat fragmentation, wildlife collisions due to Project-generated traffic, and bird window strikes to less-than-significant levels. The comment also provides recommended revisions to Mitigation Measures MM-BIO-2 through MM-BIO-5, including a requirement for a

security deposit greater than or equal to 150 percent of the estimated cost of the restoration prior to construction should some portion of, or all of, the restoration fails.

As detailed in Response to Comment Nos. O6-17 and O6-19, Project impacts due to nesting bird and special-status species habitat loss, habitat fragmentation, wildlife collisions, and bird window strikes would be less than significant, and additional mitigation is not warranted. Mitigation Measures MM-BIO-4 and MM-BIO-5 establish minimum compensatory mitigation requirements for impacts to sensitive natural communities and jurisdictional areas and require the preparation of a Restoration Plan to identify specifically how the replacement habitat would be acquired/restored. Mitigation Measure MM-BIO-4 identifies the minimum content requirements for the Restoration Plan and Mitigation Measures MM-BIO-4 and MM-BIO-5 collectively require the Restoration Plan be approved by CDFW, the U.S. Army Corps of Engineers, and the Los Angeles Regional Water Quality Control Board prior to initiating construction or any site disturbance. As the mitigation measures included in the Draft EIR commit the Project to mitigating the potentially significant impacts and include specific performance standards that must be achieved, a security deposit is not appropriate or required. In addition, as discussed in Response to Comment No. A1-8, Mitigation Measures MM-BIO-1 has been revised to further ensure that impacts to biological resources would be less than significant. The comment's recommended revisions are not warranted but are noted for the administrative record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-59

The commenter provides recommended measures for protocol surveys for burrowing owl, California gnatcatcher, and special-status bats; pest control to prohibit rodenticides and avicides; Bird-Safe Guidelines; and additional compensatory mitigation for road mortality and window strikes. The commenter also recommends using California native plants for landscaping. As stated in Response to Comment No. O6-58, Project impacts to biological resources would be less than significant, and additional mitigation is not warranted. Therefore, incorporation of the comment's recommended measures in the Draft EIR is not required under CEQA. However, the recommended measures are noted for the administrative record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O6-60

The comment claims that the Project is not in a VMT-efficient location and that the Draft EIR's assertion that the Project is in such location is based on an outdated transportation model that is known to underestimate commute VMT. The comment also asserts that Census data indicate that the actual average commute distances of workers employed in the Project area is 2.8 times greater than those identified in the Draft EIR. The map in the Draft EIR showing the location of the Project in a zone that generates above average work VMT per employee generally serves as a guideline that directs further study of individual projects within those various zones. Accordingly, further analysis of the Project's VMT impacts was conducted and included in the Draft EIR.

The 2016 SCAG model was the model that was used to establish the VMT thresholds in the Santa Clarita area and, therefore, the most logical model to use in the analysis of the Project. The use of this model is consistent with City's TAU. As described in Response to Comment No. O6-20, the calculation of VMT that concluded "average commute distances of workers employed in the project area is 2.8 times as great as asserted in the DEIR" shows the lack of understanding between average commute distance and work VMT per employee.

In addition, the location of the Jan Heidt Newhall Metrolink Station within 2,500 feet of the Project Site is further indication of the potential VMT-efficient characteristics of the Project Site. Accordingly, the VMT calculations reported in the Draft EIR are realistic and consistent with the methodology called for in the City's TAU.

Response to Comment No. O6-61

The comment questions the commute distances used in the calculation of the Project's VMT. The "temporary" workers generated by the Project are likely to be on-site for months at a time. The calculation of work VMT per employee is based on the residential location of the worker and the mode split of the employee travel to the Project Site. There is nothing in the calculation of work VMT per employee that is affected by the length of the employee's tenure on-site. The regional travel demand forecast model used to predict the geographic distribution of Project employees takes into account the regional distribution of both residential and employment land uses and estimates the most likely distribution of employees based on the regional pattern of employment opportunities. Accordingly, the calculation of work VMT is made independent of the temporary vs. short-term vs. permanent employment status.

Response to Comment No. O6-62

The comment begins with an incorrect statement that the Project's VMT impacts require mitigation because the Project was found to have no significant VMT impacts, and, therefore, VMT mitigation measures are not required.

The comment is correct that a TDM Program for a Project with a combined permanent and non-permanent employee base is difficult to manage. For this reason, the VMT analysis in the Transportation Assessment and in Section 4.14, Transportation, in the Draft EIR, did not take any trip reduction credit based on the potential effects of a TDM Program.

The very nature of a studio campus results in flexible hours because the industry typically begins the day prior to the typical commuter peak hour and ends prior to the afternoon peak commuter hour. While this offset schedule does not affect the VMT calculations of the Project, it does reduce the peak hour congestion that affects the neighborhood and the commuters driving past the Project Site.

The TDM Program for the Project Site is divided into two parts. The first part comprises the permanent TDM measures that would be implemented by the applicant. These would include support for carpool matching services among the on-site employees, on-site bicycles to move around the campus, carpool priority parking locations, and an on-site transportation information center. The second part of the TDM Program comprises the TDM measures that would be sponsored by the tenants of the Project and could include shuttles to the Metrolink Station, Guaranteed Ride Home Program for transit users, and telecommuting opportunities.

Response to Comment No. O6-63

The comment claims that the GHG impacts in the Draft EIR were underestimated because the trip generation used in the air quality analysis (7,021.82) is less than what was presented in the Transportation Analysis (7,293). The comment also alleges that the trip lengths assumed in CalEEMod were too low based on the Census Data for the existing commuting to the Project area.

At the time the air quality analysis using CalEEMod was conducted, the most conservative estimate of trip generation was the default rates in the model, which resulted in 7,021.82 trips per day. While

the final version of the Transportation Analysis includes a slightly higher (approximately 4 percent) trip count, the GHG emissions analysis is still valid. The addition of approximately 272 trips would result in an increased emissions of mobile vehicles of approximately 334 $MTCO_2e$ annually. This was determined by taking the total mobile source emissions of 8,627 $MTCO_2e$, dividing it by the total number of trips (7,021) and multiplying that by the increase in trips of 272. The total annual GHG emissions attributed to the Project would increase by less than 3 percent to 11,707 $MTCO_2e$. Regardless of the slight increase in GHG emissions from the increase in trips, the significance determination for the Project is based on consistency with the State and regional GHG reduction plans, and, as such, the additional GHG emissions from the increased vehicle trips would not change the significance determination for the analysis.

With regard to trip lengths, the CalEEMod defaults were used because the defaults were greater than the VMT identified in the Transportation Assessment to ensure the analysis was conservative. In addition, the use of the default values in CalEEMod associated with the Project area is an approach recommended by the Air Districts, which approve of the use of the CalEEMod defaults where project specifics are not available.

To reflect the trip count noted above, the following revisions to the Draft EIR were made:

- The last sentence in the first paragraph on page 4.7-13 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  Operation of the Project would generate approximately ~~11,373~~ 11,707 $MTCO_2e$ per year, which includes the amortized construction emissions.

- The Mobile Emission Source and the Total Annual Emissions in Table 4.7-2 on page 4.7-13 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR, were revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

Table 4.7-1
PROJECT OPERATION GREENHOUSE GAS EMISSIONS

Emission Source	Annual Emissions (MTCO2e)
Construction[a]	196
Operation	11,177
Area	<1
Energy	1,688
Mobile	~~8,627~~8,960
Solid Waste	774
Water	12
Generators	37
Food Trucks[b]	39
Total	**~~11,373~~11,707**

Notes:
$MTCO_2e$ = metric tons of carbon dioxide equivalent.
[a] Amortized construction-related GHG emissions over 30 years.
[b] Food truck emissions account for electricity and waste emissions only. Mobile emissions are assumed to be part of the anticipated daily emissions quantifications and are included under mobile emissions.
*Refer to **Appendix C** of this Draft EIR for detailed model input/output data.*
Source: Rincon Consultants, Inc. 2023.

- The last sentence in the last paragraph on page 4.7-13 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

  As shown in **Table 4.7-3**, operation of the Project with the application of the reductions discussed above would generate approximately ~~7,252~~ 7,586 MTCO2e per year.

- The Mobile Emissions and the Total emissions in Table 4.7-3 on page 4.7-14 in Section 4.7, Greenhouse Gas Emissions, of the Draft EIR were revised as follows:

Table 4.7-2
PROJECT OPERATION REDUCED GREENHOUSE GAS EMISSIONS

Emission Source	Annual Emissions ($MTCO_2e$)
Construction[a]	196
Operation	7,056
Area	<1
Energy	1,688
Additional Renewables Portfolio Standard Reduction	(183)
Mobile	~~8,627~~8,960
Electric Vehicle Charging Stations	(3,357)
Solid Waste	774
Assembly Bill 341	(581)
Water	12
Generators	37
Food Trucks[b]	39
Total	**~~7,252~~7,586**

Notes:
$MTCO_2e$ = metric tons of carbon dioxide equivalent.
[a] Amortized construction-related GHG emissions over 30 years.
[b] Food truck emissions account for electricity and waste emissions only. Mobile emissions are assumed to be part of the anticipated daily emissions quantifications and are included under mobile emissions.
*Refer to **Appendix C** of this Draft EIR for detailed model input/output data.*

Response to Comment No. O6-64

The comment questions the VMT analysis conducted for the Project. This comment is similar to Comment No. O6-20. Please refer to Response to Comment No. O6-20 above.

Response to Comment No. O6-65

The comment claims that the temporary workers generated by the Project would be drawn from the large Los Angeles County labor force employed in the film and video industry and that it is possible that commuters to the Project would travel longer distances, on average, than those currently commuting to the Project area. However, the comment does not provide substantial evidence to support the statement. This comment is similar to Comment No. O6-61. Please refer to Response to Comment No. O6-61 above.

Response to Comment No. O6-66

The comment claims that the Project is not a VMT-efficient location and may induce long commutes given the characteristics of the Project and that mitigating VMT impacts is essential. However, the comment does not provide substantial evidence to support the statement. This comment is similar to Comment No. O6-62. Please refer to Response to Comment No. O6-62 above.

Response to Comment No. O6-67

The comment claims that the number of trips used in CalEEMod is lower than the number of trips in the transportation analysis and that the CalEEMod analysis should be redone with the correct number of trip generation. This comment is similar to Comment No. O6-63. Please refer to Response to Comment No. O6-63 above.

Response to Comment No. O6-68

This comment is similar to Comment Nos. O6-1, O1-1, and O1-2. Please refer to Response to Comment Nos. O6-1, O1-1, and O1-2 above.

Response to Comment No. O6-69

This comment is in response to a public records request. Please refer to Response to Comment Nos. O6-1, O1-1, and O1-2 above.

Response to Comment No. O6-70

This comment is similar to Comment Nos. O6-1, O1-1, and O1-2. Please refer to Response to Comment Nos. O6-1, O1-1, and O1-2 above.

Response to Comment No. O6-71

The comment is in regard to the extension of the comment period for the Draft EIR. Please refer to Response to Comment No. O-1 above.

Response to Comment No. O6-72

The comment requests mailed notice of the availability of any environmental document related to the Project pursuant to CEQA, as well as notice of any and all hearings, meetings, and/or actions related to the Project. CREED LA has been included in the City's mailing list.

Response to Comment No. O6-73

The comment was directed to Chair Berlin and the Planning Commission and submitted during the 45-day comment period to extend the comment period and defer any action by the Planning Commission to a date after the public comment period. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Sent via email to eiverson@santa-clarita.com

Re: Newhall Studio Project 21-109 Request for an extension to review the EIR and DEIR initial comments
Please copy to all members of the Planning Commission

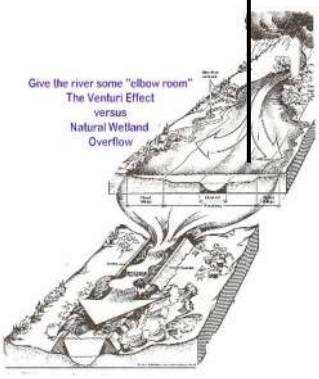
Dear Ms. Iverson and Planning Commission Members

Friends of the Santa Clara River (FSCR) was formed in 1993 to provide public oversight and demand protection for the Santa Clara River and its tributaries. The Placerita Creek and its floodplain are tributaries to the Santa Clara River and thus we present these initial comments to advocate for the stewardship and preservation of the river and its water resources. **O7-1**

The Santa Clara River provides water supply and habitat for humans and other species, including many endangered and fully protected species, along its reaches. Without careful stewardship, these resources will not exist for future generations.

We request an extension of time to comment on this DEIR. We were not notified of this project in spite of our considerable history of activity in relation to the SC River and its tributaries. The City and the developer released this document immediately before important religious holidays when volunteer organizations such as ourselves would be spending time with family and not be aware of a public release. We provide these initial comments and suggestions in order to abide by the short review period, but intend to submit additional comments that would protect both the public and the watershed in a few weeks. **O7-2**

Hydrology Study Deficient **O7-3**
The hydrology report only discusses run off from the project but does not discuss flows resulting from ARk storms (atmospheric rivers) as predicted by USGS[1] as a result of global warming and have recently occurred in this area. The floodplain of Placerita creek has acted to protect upstream residents from such new phenomena by allowing the creek to spread out across the flood plain. This project proposes to riprap and narrow the streambed (in violation of



[1] https://www.usgs.gov/centers/western-geographic-science-center/science/arkstorm

the Placerita Community Standards District). This could result in upstream flooding as demonstrated be the above diagram.

California's weather has always alternated between floods and drought. So we must prepare for both. As global warming causes more extremes in both areas, it is imperitive that we adapt our planning to prepare for this new reality. Preserving the floodplain will not only protect upstream residents but also ensure recharge of the ground water basin so that both this facility and others have an adequate water supply.

The proposal to narrow and riprap the creek is a significant impact. We therefore urge the City to not to allow building over the flood plain, by adopting either Alternative 2 or Alternative 3 and requiring:

- further setbacks from the creek and
- requiring all paved portions of the project to use permeable pavement

as mitigation requirements and conditions of approval.

Loss of natural flood plains will make the impacts of climate change worse. According to the State Climatologist, Michael Anderson, Ph.D., P.E. at California Department of Water Resources Division of Flood Management:

O7-3
Continued

"Variability in annual precipitation statewide and across the regions of the state has increased since the early 1980s, peaking in the late 1990s for most climate divisions (Figure 3) (He &Guatam, 2016). This shows that dry and wet precipitation extremes have become more frequent."

Based on the State Climatologist statement that wet extremes have become more frequent, prudence requires that flood plains be protected. Other agencies also suggest that the best way to protect communities from flooding is to protect the floodplain.[2] We ask for the protection of this flood plain to ensure public safety and for the increase water reliability it will provide.

Climate Change and Water Supply

River and creek flood plains provide space for the river during extreme rainfall events. High water levels are able to spread across these plains which reduce downstream flood potential and provide a natural means for groundwater recharge. Reduction in the size of the floodplain will have consequences for existing and planned development downstream with regard to erratic river behavior due to higher and faster flows and reduction in the local water supply.

We therefore believe that this EIR is deficient in its failure to asses loss of ground water recharge from impermeable surfaces and a mitigation requirement to address this issue.

Water Supply Assessment

In a 2008 Santa Clarita Valley water related appellate court decision[3], the 2nd appellate Court ruled that the public may not bring CEQA and other objections to Water Supply Assessments until the EIR stage of the project. Thus, we notice you with our objection here to certain

O7-4

[3] Cal.Rptr.3d ----, 2008 WL 1735399 (Cal.App. 2 Dist.), 08 Cal. Daily Op. Serv. 4413, 2008 Daily Journal D.A.R.5483

assertions made regarding water supply in the upper watershed of the Santa Clara River. However, since we have been provided inadequate notice and time to reply, these comments will be made after the end of the comment period but prior to the final EIR. We remind both the City and the developer that these comments, though outside your time restrictions (which we object to, see previous comments above) must still be considered.

O7-4 Continued

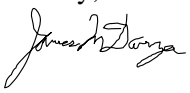
Conclusion

We believe that the need for housing outweighs the need for yet one more film studio in the Santa Clarita Valley and that therefore you should approve Alternative 2, the original zoning. However, should you vote to approve this project, we urge you to adopt Alternative 3 with the additional recommendations we have made, as the environmentally superior alternative. A reduced project foot print would allow room for an extended setback from the creek and additional preservation of some of the magnificent oaks present on the site. We urge you to support these alternatives in order to ensure future water reliability for all residents, both in your area and downstream, and protection from flooding for upstream residents, as well as a functioning ecosystem for riverine species.

O7-5

Thank you for your time and attention to these issues.

Sincerely,



James M. Danza, MS, AICP
Chair, Friends of the Santa Clara River

Letter No. O7
James M. Danza, MS, AICP, Chair
Friends of the Santa Clara River

Response to Comment No. O7-1

This is an introductory comment that states the purpose of the Friends of the Santa Clara River (FSCR) and briefly describes the Placerita Creek and Santa Clara River. The comment does not address the adequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted.

Response to Comment No. O7-2

The comment requests an extension of time to comment on the Draft EIR, claims that FSCR was not notified of the Project, and states that the Draft EIR was released before important religious holidays. The comment also expresses FSCR's intention to submit additional comments to the City.

In compliance with the requirements of CEQA, the City published and distributed the Project's NOP on March 28, 2022, which notified interested agencies; organizations, including FSCR; and persons that the City would be preparing an EIR for the Project and invited comments on the scope and content of the EIR. FSC was included on the City's mailing list. The public review period for the NOP was from March 29, 2022, to April 28, 2022. The City held a public scoping meeting on April 21, 2022, and accepted comments on the scope and content of the EIR. On April 6, 2023, the City published and distributed the Notice of Completion and Notice of Availability of the Draft EIR, which notified interested agencies; organization, including FSCR, and persons that the City was accepting comments on the Draft EIR. The public review period for the Draft EIR began on April 6, 2023, and ended on May 22, 2023. In addition, three Planning Commission meetings were held on April 18, 2023, May 16, 2023, and June 20, 2023, to solicit comments from the public and the Planning Commission on the Draft EIR. As such, the City has provided sufficient notification and multiple opportunities for public input during the Shadowbox Studios EIR process. The public review process undertaken by the City for the Draft EIR fully complies will all requirements of CEQA and the CEQA Guidelines. Given the above, and based on direction provided by the City's Planning Commission, the Draft EIR review period was not extended.

Response to Comment No. O7-3

The comment claims that that Hydrology Study approved by the City of Santa Clarita is deficient and states that it "only discusses run off from the project and not the flows resulting from the Ark storms as predicted by the USGS as a result of global warming." The comment also asserts that rip rap and narrowing of the streambed would violate the Placerita Canyon Special Standards District (PCSSD) and could result in upstream flooding. The Conditional Letter of Map Revision (CLOMR) drainage study that has been prepared by Chang Consultants dated September 2022 utilized current FEMA 100-year data/mapping for the drainage analysis, which is standard practice by FEMA. The Placerita Creek Hydraulic Analysis Report, also prepared by Chang Consultants in January 2022 (Chang Report), analyzed both the existing and developed condition for the Placerita Creek drainage and concluded that there would be no adverse impact to the Project Site or upstream properties, contrary to the statement in this comment. Furthermore, the Project would

be required to undergo multiple City reviews to ensure that the Project's proposed buried rock bank stabilization of Placerita Creek would comply with the requirements of the PCSSD.

The comment further claims that narrowing and riprapping Placerita Creek would result in a significant impact due to the loss of a natural flood plain, which would worsen the impacts of climate change and reduce local water supply. However, the comment presents no other information or substantial evidence to support its claim regarding the loss of a natural flood plain or how stabilization of Placerita Creek would worsen the impacts of climate change. Contrary to the comment, as discussed in detail on pages 4.9-19 and 4.9-20 in Section 4.9, Hydrology and Water Quality, of the Draft EIR, the Project would provide enhanced flood control protection along Placerita Creek. In addition, a portion of the off-site stormwater, during peak storm events, would be routed to the Project's proposed infiltration/drainage basin. A 50-year storm event was also modeled for off-site subareas. The total existing flow rate generated by the off-site drainage area is approximately 375 cubic feet per second (cfs), and the flow rate generated by the Project would be approximately 197 cfs. To bring the total on-site Project flow rate down to the existing flow rate, approximately 178 cfs (during storms greater than or equal to the 10-year storm) would be split from the total off-site flow and diverted to a desilting inlet, conveyed through the Project, and sent to the drainage basin in the northern portion of the Project Site. A splitter manhole would allow up to 40 cfs from a storm event to pass through to Placerita Creek. An outlet from a splitter manhole would divert additional flow from larger storms, before passing through a weir that would continue through the manhole and outlet to Placerita Creek. The Project design would allow for stormwater to be contained and treated on-site through the use of an infiltration/detention basin and underground infiltration chambers, then released to Placerita Creek, ensuring that stormwater runoff rates and volumes entering the creek do not exceed existing stormwater runoff rates and volumes or change the currents, course, or direction of surface water that would affect Placerita Creek as a result of Project implementation. Only treated runoff and at quantities equal to or less than the existing volume would be released.

The comment also urges the City to adopt either Alternative 2 or Alternative 3 with the requirement for further setbacks from Placerita Creek and the use of permeable pavement as mitigation measure and/or conditions of approval. The comment's requests will be forwarded to the decision-makers for their consideration. However, as described in Section 4.9, Hydrology and Water Quality, of the Draft EIR, the Project would not result in significant impacts related to flooding, floodplains, groundwater recharge, or drainage. Therefore, additional mitigation measures are not warranted.

Regarding the claim that the Project would reduce local water supply, as previously discussed in Response to Comment Nos. O3-5 through O3-7 above, the Project would incorporate an infiltration/drainage basin, a low-flow drainage system and landscape designed to minimize runoff. On-site runoff from the Project Site would be captured in a closed pipe system and conveyed to Placerita Creek, a soft-bottom drainage channel that allows for percolation of surface water. Moreover, prior to discharging into Placerita Creek, the first-flush runoff would be routed to underground infiltration chambers or infiltration/drainage basin proposed for the Project. Additionally, a portion of the off-site stormwater, during peak storm events, would be routed to the infiltration/drainage basin. The Project's proposed drainage/infiltration system would capture the first ¾ inch of rainfall from each storm event and use infiltration chambers/basin to infiltrate this rainfall back into the earth. Given this proposed system, the Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge.

Response to Comment No. O7-4

The comment expresses FSCR's objection to the Project's Water Supply Assessment (WSA) and states that specific comments to the WSA will be provided to the City after the end of the comment period but prior to the Final EIR. The comment states that City and developer must consider these late comments. Since no specific issues related to the WSA or Draft EIR are included in this comment, the comment is noted, and no additional response is warranted.

Response to Comment No. O7-5

The comment requests that the City approve Alternative 2 with the original zoning or Alternative 3 with FSCR's additional recommendations as the environmentally superior alternative. FSCR believes that these alternatives would ensure future water reliability for all residents, both in the Project area and downstream, and protection from flooding for upstream residents, as well as a functioning ecosystem for riverine species. However, the comment presents no other information or substantial evidence to support its claim. In addition, as discussed on page 5.0-22 in Section 5.0, Alternatives, of the Draft EIR, under Alternative 2, the water demand of 373 acre-feet per year (AFY) of water would be greater than the 207 AFY of water under the Project. With the exception of the bridge across Placerita Creek, Alternative 2 would also provide the same Placerita Creek stabilization as the Project. Furthermore, as described on page 5.0-7 in Section 5.0, Alternatives, of the Draft EIR, although Alternative 3 would reduce the development's square footage, it would require the same amount of grading as the Project, construct a bridge over Placerita Creek and provide the same bank stabilization as the Project, and disturb the same footprint as the Project. Accordingly, from a hydrological perspective, particularly as related to upstream and downstream conditions before and after development of the Project Site, impacts to hydrology and water quality under Alternatives 2 and 3 would be similar to the Project's less-than-significant impacts.

Re: Shadowbox Studios Project
Master Case Number 21-109
Our client: Placerita Canyon Property Owner's Association ("PCPOA")
Comments to Draft EIR

Dear Ms. Iverson,

This firm has been retained by Placerita Canyon Property Owners Association ("PCPOA") to review and provide comments to the Draft Environmental Impact Report ("DEIR") for the proposed Shadowbox Studios Project ("Project"). Our comments are made on behalf of the Association as a whole. Members may be making individual comments.

REQUEST FOR AN EXTENSION TO PUBLIC COMMENT PERIOD

The record should reflect that on April 19, 2023, PCPOA initially requested a 15-day extension of the period within which to provide public comments to the DEIR. This request was made on two bases. The obvious is that the Project, as proposed, will result in over 1.2 million square feet of development and likely over 3,000 new people into an area which is (i) adjacent to an area which is, by City design and standards, of an equestrian, pastoral and quasi-rural character; (ii) already subject to traffic congestion; and (iii) which will essentially gridlock the only emergency escape route for Canyon residents and their livestock during the inevitable disaster, including wildfire, flooding, or earthquake. **O8-1**

A subsequent extension request by PCPOA was made on May 16th because the City did not provide public record documents requested through a public records request of April 19, 2023 until approximately 4:53 PM on May 15th. PCPOA's requests were denied with the only stated reason for the denial being (paraphrasing) that the City has dealt with bigger EIRs in the past. The denial of PCPOA's modest request for an extension was shocking given that the purpose of CEQA is to ferret out all relevant information regarding potential environmental impacts of a proposed project so that, "...the government and public [may be informed] about a proposed activity's potential environmental impacts..." (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 381.) PCPOA consists of a group of property owners

who are not experienced or adept enough to conduct an evaluation or provide meaningful input so that the ultimate decision makers have all the necessary information in front of them when making their decision. That is the heart of CEQA and one would expect that the City, keeping the interests of everyone in mind, would welcome as much meaningful and diverse input as possible from its citizens who will be most impacted by the Project.

Unfortunately, the Planning Commission summarily denied the modest extension requested by PCPOA. The only reasons for the denial articulated by the Planning Commission were that the City has dealt with bigger EIRs before and that the public had enough time to comment on those without extensions. This "reasoning" is both wrong-headed and bewildering. First, the impact on the environment and community of every project is different. Were those "big" EIRs for projects with the potential to jeopardize the safety and quality of life in a manner similar to Shadowbox's impact? Was there an active group who was attempting a good faith evaluation and comment on the project's impact? The bewildering part of the reasoning is that the requested extension was extremely modest and expressly authorized under CEQA Guidelines section 15105. The modest extension would have had very little effect on the progress of the Project. What possible detriment or prejudice could there be from a two-week extension to comment? **O8-1 Continued**

Moreover, on April 19, 2023, our firm, on behalf of PCPOA, provided a public records request to the City for documents that would assist in PCPOA's review of the DEIR. On May 1, 2023, after our inquiry, we were told that pursuant to the extension provisions of the Public Records Act, no response would be forthcoming from the City until May 15th. Thereafter, close to 5 PM on May 15, 2023, the day before the May 16th Planning Commission Hearing, we received what can best be described as a document dump from the City. The next day, at the Hearing, PCPOA's request for an extension of the time to comment was denied.[1]

Because of the frivolous decision of the Planning Commission to deny the request for an extension, the City's CEQA process for the Project is flawed. The public was not given adequate time or opportunity to provide meaningful comments. This is not only bad government but not in line with the purpose underlying CEQA. Should any legal action challenging the Project or the **O8-2**

[1] Having had an opportunity to merely scan the contents of the document dump, we find that the developer appears to have been provided at least a part of the administrative draft EIR well before it was released to the public and has, in fact, requested that certain language be inserted in the mitigation measures to meet the developer's desires. We are looking into this further as time permits but, based on what we have seen, whether the City seems to have decided that the preparation of this DEIR is a joint effort between the consultant, the developer, and the City. While a developer's involvement at that stage may not technically be prohibited by CEQA, many, if not most jurisdictions, avoid this appearance of impropriety and provide the developer and the public the draft EIR at the same time reserving the administrative draft for internal staff comments. The developer's early and preferential input places the City's refusal to grant the Association (and the public) a 15-day extension in an unflattering light.

process be necessary, we intend to raise the inadequate and inequitable duration of the comment period. Furthermore, by failing to provide adequate time to review and comment on critical project issues raised by the DEIR, we intend to continue to provide comments on the DEIR up to the time of certification. *Bakersfield Citizens for Local Control v. City of Bakersfield* 124 Cal. App. 1184 (2004); *Galente Vineyards v. Monterey Peninsula Water Management Dist.* 60 Cal. App. 1109 (1997). It is unfortunate that the City has put itself and the developer in this position. O8-2 Continued

DEIR Comments

We want to indicate that PCPOA does not necessarily oppose the concept of the Project. It recognizes that motion picture production has historically been and should continue to be an important part of the character of Santa Clarita. Evidence of that fact can be found with Melody Ranch Movie Ranch around which the Placerita Canyon community developed. That said, PCPOA is committed that the expansion of film production neither impact the safety of Placerita Canyon residents nor forever destroy the rural, equestrian-oriented environment which has been fostered by government and private regulation dating back well before City incorporation. Critical to preserving the rural and equestrian-oriented lifestyle is the CEQA requirement that the DEIR provide a complete and good faith analysis of all potential significant project impacts. We believe that the draft DEIR fails to meet that standard and is so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment are precluded. (Mountain Lion Coalition v. Fish and Game Com. (1989) 214 Cal.App.3d 1043.) Below we set out more specific comments to the DEIR on an itemized basis and based on time constraints and limited available information. Initially, we point out foundational flaws that permeate many sections of the document. O8-3

- We question an environmental document for a project of the magnitude proposed arriving at the conclusion that there are no significant environmental impacts other than biological, cultural and geological. The DEIR found **no impacts** to anything relating to the safety and environment of the residents of the Placerita Canyon Community. The Project includes nearly 1.3 million square feet of structures, 2400 parking spaces, will create new on-site jobs for roughly 3,000 people, includes 19 massive sound stages, three-story office buildings and a five-story parking structure (necessitating a variance of the City's height restrictions and creating some of the Valley's highest structures). All this is located (i) in an area currently designated as residential under the City's General Plan and Zoning Ordinance; (ii) adjacent to a neighborhood that, through careful planning and management, is a semi-rural equestrian setting; and (iii) in a historically high wildfire zone with very limited means of emergency ingress and egress which will be dramatically limited by setting at least 3,000 souls with 2,500 vehicles at the mouth of such the emergency egress point. "The EIR must contain facts and analysis, not just the bare conclusions of the agency," and, "…must include detail sufficient to enable those who did not participate in O8-4

its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Association of Irritated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1390.) We will provide more detail below but, on its face, the premise that this enormous project is consistent with the neighboring community and **has no significant environmental impacts** is difficult to believe, if not completely absurd. Given that the DEIR finds no impacts to the surrounding community, no mitigation measures are imposed nor are conditions of approval suggested. Thus, there will be no meaningful community and safety protections in place.

O8-4 Continued

- Much of the analysis relating to traffic, critically including emergency ingress and egress, seems to assume that the Dockweiler improvement and extension will be completed before the Project is operational. However, that is neither a mitigation measure nor, so far as we can tell, a precondition of this project. In fact, based upon the information we were able to glean in our brief review of the City's last minute document dump, the developer is adamant that it is not responsible for those (and other related improvements) but, rather, are obligations of the City. Unless the Project operations are conditioned on the completion of the Dockweiler improvements, the analysis within the DEIR is nonsensical, useless, and inappropriate under CEQA. CEQA requires that the City use as its baseline, with very limited exceptions, "...physical environmental conditions as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced…" The Dockweiler project is not yet complete rendering the City's environmental analysis deficient to the extent it relies on the completed project as its baseline for CEQA analysis. We recognize the City's statement that it intends to complete the project but there would be nothing unusual for a planned City improvement to be delayed for years or abandoned altogether. At the May 16, 2023 Planning Commission meeting, questions were asked of both the City and the traffic consultant attempting to clarify the extent of reliance on the Dockweiler project in the DEIR and its timing. The responses were obtuse leaving the issue extremely unclear. It is a very simple proposition and deserves a very simple answer. Simply put, if completion of the Dockweiler Project is not a mitigation measure or condition of Project approval, the DEIR is worthless and violates the requirements of CEQA.

O8-5

- The cavalier attitude of the DEIR with respect to emergency evacuation is befuddling. The Project will add 2,500 vehicles to an already congested area at the "mouth" of the primary emergency ingress, egress point yet the DEIR does little if anything to address this other than note that the evacuation time will be reduced if and when the Dockweiler improvements are made. Placerita Canyon is an area of extreme wildfire danger and emergency ingress, egress is critical for the safety of the residents. The fact evacuation

O8-6

will necessarily include many horse trailers (either coming in or leaving) to evacuate horses and other livestock was not considered. The evacuation of horses which is an integral part of the character of Placerita Canyon must be taken into account in evaluating the safety of the Project. Moreover, the DEIR summarily dismisses the roundabout concept which could significantly assist in aiding emergency evacuation and fails to discuss the possibility of providing an additional emergency ingress, egress route for Placerita Canyon. These omissions, on what is the most critical impact needing to be analyzed, are disturbing and render the DEIR inadequate and flawed.

O8-6 Continued

4.1 Aesthetics

The DEIR notes that the Project is subject to the Santa Clarita Community Character and Design Guidelines ("Design Guidelines") noting that the Design Guidelines are "intended to ensure that existing and future development is comparable in **size, scale and appearance with the existing neighborhood character…"** and that the site "is located withing the Placerita Canyon subcommunity, which is identified by the guidelines as a **rural, oak-studded, equestrian-oriented residential area…"** Elsewhere, the DEIR notes that the current general plan and zoning designation for the Project Site, consistent with the Design Guidelines, is residential. The DEIR goes on to acknowledge that the Project site is located in the Placerita Canyon Special Standards District which is made up "primarily of low-density, equestrian-oriented residential neighborhoods located *east* of the Project Site."

With that regulatory background, the Aesthetics analysis of the DEIR discusses the impact of the Project on surrounding views. Of particular concern to Association members are the views "from the East" which, as noted are "*residential properties…considered sensitive viewing locations.*" The DEIR analysis deftly limits the Project characteristics considered in the view analysis to the catering building and the facilities building and provides that those two buildings will be screened from "largely screened from the adjacent residential uses to the east by the nursery, landscaping and fencing." In other words, the City acknowledges that the Project will negatively impact the views from the sensitive viewing locations but puts forward the nursery, landscaping and fencing as supposedly mitigating the impact. (The DEIR, again, coyly, does not use the term "mitigate" but that is the only conclusion that can be drawn from the analysis). Nevertheless, despite the clear evidence and analysis to the contrary, the DEIR finds that no mitigation measures are required to protect sensitive viewing locations. That is contrary to the analysis. One must wonder why these necessary screening measures (never mind if they work) were not included as a mitigation measure to ensure that the developer and future owners both construct and maintain the Project to the sensitive viewing locations.

O8-7

A second issue with the analysis of the impacts of the views from the sensitive viewing areas is the fact that the analysis was limited to two, relatively small (at least in the scope of the

O8-8

Project) buildings. Are we to assume that the 19 foot sound stages, three-story office buildings and five story parking structure (which exceed the City's existing maximum height restrictions for this zone) will simply be outside of view from the sensitive areas? Perhaps, though unlikely, that is the case. The DEIR, however, provides no analysis or evidence to support that very questionable conclusion and thereby fails to its purpose. CEQA requires, and the City and public should expect, a full analysis of the Project impacts. That full analysis requires an analysis of all potential and foreseeable impacts. The intrusion of the massive structures proposed by the Project – which, to reiterate, exceed the maximum allowable height for the MXN mixed-use zone – will certainly have a negative impact on the sensitive viewing location of the Placerita Canyon Community.

O8-8 Continued

4.10 Land Use Planning

The DEIR analysis with respect to Land Use Planning is a bit of a shell game. The status quo is that the Project Site is designated for residential use under the City's General Plan and Zoning Ordinance (974 units per Table 5-1 of the DEIR). Properly designed and developed housing on the Project Site would meet the current designation and could avoid the inherent conflict with the rural and equestrian- oriented residential adjacent neighborhood. The Project, which includes a change in the land use designation from residential to industrial, by its very nature creates a significant environmental impact particularly on the Placerita Canyon Community. Where there was housing, there is now a massive industrial development. There is an impact.

O8-9

In its analysis, the DEIR focuses on the Old Town Newhall Specific Plan standards and simply declares, without any real analysis, that due to the promised architectural treatment of the massive structures, the Project looks good enough to fit in with the design guidelines for the Newhall Community. By contrast, the Placerita Canyon Special Standards District discussion is limited to a single block in Table 4.10-2 labeled "Applicable General Plan Policies." In that block, while noting the requirement to "ensure compatibility of development with existing rural equestrian lots and the adjacent Forest Land….City and the Placerita Canyon Property Owners Association shall work together to amend the PCSSD in the Unified Development Code to provide additional certainty and expectations for the developed areas within the District to create flexibility and continuity, subject to the provisions outlined above, for undeveloped properties in the District."

O8-10

To our knowledge, the City has not worked with PCPOA to develop amended standards applicable to undeveloped properties. In fact, the current PCSSD standards are not discussed in detail in the DEIR and, if they were, it would be abundantly clear that the Project does not meet those standards. If the suggestion is that those standards should be amended to address this Project and thereby satisfy the City's Land Use Policy 1.2.6, there should be discussion and analysis recognizing and detailing the PCSSD standards and analyzing what must be addressed and amended to accommodate the Project. It is simply inadequate to cite the policy and its requirements and then avoid any discussion of the specifics. The question is not whether there is

an impact but what can and should be done to address those impacts. Given the conflicting character of the Project with the established Placerita Canyon Community, this discussion would likely be somewhat difficult. Difficult or not, the analysis must be undertaken. **O8-10 Continued**

Moreover, under the heading of "Consistency", there are only two factors mentioned, both of which are inadequate to ensure that the Project is compatible with the surrounding area. One of those is the simple statement that the Project will have to go through other City processes, which are described only in very general terms without any detail or explanation as to how they might shape the project or, more importantly, what project characteristics should be analyzed to ensure compatibility. In short, any compatibility analysis relating to the Placertia Canyon Community is omitted. The City's staff report presented during the Planning Commission's May 16 meeting was woefully inadequate in addressing these myriad issues; at a minimum, these new impacts are sufficient to require additional discussion and mitigation measures which will trigger the requirement that the City recirculate this EIR for public review under *CEQA Regulations*. The proverbial "can" is kicked down some loosely described road without any guidance. This simply does not come anywhere close to the level of analysis on which the decision makers, ultimately the City Council, can rely. This deferral of review, analysis and mitigation is inadequate and violates CEQA requirements. **O8-11**

The second factor noted in the consistency review is that "the Project's location in the North Newhall Area already imposes the requirement of public participation and outreach to the Placerita Canyon Property Owners Association." This statement is misleading . First, Policy LU 1.2.6 has the requirement that the City and PCPOA work together to develop standards for new development. That requirement is prospective-it must happen before a new project is being considered. That did not happen and it is no answer to now say that a retrospective look at the District standards is sufficient to satisfy Policy LU 1.2.6 to the level of General Plan compatibilityTthe DEIR suggesting that closing the barn door after the horse leaves is an acceptable level of analysis. It is also somewhat ironic if not insulting that the DEIR refers to the "public participation and outreach to the Placerita Canyon Property Owners Association" while, at the same time, the City is trying to rush through the Project approval by denying the Association even a modest request to extend the time for public comment on the DEIR. We fully understand that navigating a general plan is a somewhat tedious exercise requiring a balance of competing policies. Our concern is that the DEIR does not provide sufficient information or analysis so that the City can meaningfully balance those policies. Certainly, this is a "can" that should be addressed now and not delayed until after Project approval renders the analysis moot. **O8-12**

The DEIR also purports to consider whether the Project will be consistent with the City Municipal Code. Our attention is focused on the "analysis" given to consistency with the Placerita Canyon Special Standards District. We have noted above that the purpose of the District is to protect the rural and equestrian-oriented nature of the Placerita Canyon Community. The "analysis" provided by the DEIR at page 4.10-39 is to simply ignore anything to do with the **O8-13**

character of the residential community and, instead, make selective reference to vague and general Project characteristics none of which appear in the form of mitigation measures. For example, the supposed nursery with the MWD right-of-way is cited as a project characteristic shielding the neighbors from the industrial views. We don't agree that this is sufficient but, it does evidence two points that run through the flawed DEIR. One, there is no discussion as to whether the MWD has agreed to allow the nursery. One is left to wonder whether there is an agreement in place and, assuming there is one, what are the terms of that agreement. If the nursery is an important factor in protecting the neighborhood from industrial views (and it must be as it is mentioned many times throughout the DEIR), then it is mandatory that the nursery be something real and achievable and not simply something a developer intends but is not obligated to implement.

O8-13 Continued

Along the same lines, the DEIR consistently equates project characteristics with mitigation and accepts that those characteristics will be in place. This is a flawed analysis. The analysis should be that the Project does have significant impacts but there are mitigation measures that reduce those impacts to insignificance. The analysis should include the effect upon the Special Standards District for Placerita Canyon. These mitigation measures will be used by the City to set conditions of approval for the Project to ensure that the "mitigating" project characteristics are mandatory. Thus, assuming it does act as an acceptable shield, the creation and maintenance of the nursery, or its equivalent, should be a mitigation measure mandating the maintenance of the nursery throughout the life of the Project. Otherwise, the DEIR is simply analyzing a project in a form that may or may not happen. In short, the acceptance of project characteristics as "mitigating" potential impacts, without imposing those characteristics are mitigation measures is a useless exercise and renders the DEIR and all CEQA analysis fatally flawed. It is difficult to accept and understand why the DEIR consistently goes to such pains to avoid acknowledging the potential impacts, which therefore preclude imposing measures to mitigate those impacts to a level of insignificance.[2]

O8-14

4.12 Population and Housing

The EIR notes that the City's state housing allocation is approximately 10,000. The EIR also recognizes that the Project Site's current land use designation is residential with the potential

O8-15

[2] This comment is applicable throughout the DEIR. Nowhere in the DEIR, at least for any topic relevant to the safety and lifestyle of the Placerita Canyon Community, is it acknowledged that there will be significant environmental impacts which must be addressed by mitigation measures and conditions of approval. Instead, mitigation of those impacts is left up to the goodwill of the developer for implementation and maintenance. That is the very purpose of an EIR. As presented by the DEIR, the City is left to simply accept the developer's goodwill to implement project characteristics that are relied upon by the DEIR to determine to find no significant impacts. This is fundamentally inapposite to the spirit and letter of CEQA.

for providing 974 additional housing units, of which almost 20% are affordable, to the City's housing stock.[3] The Project will remove the possibility of residential development on the Project Site and thereby remove nearly 10% of potential housing units potentially available within the City. At the same time, the Project will create approximately 2,400 **new jobs.** Thus, based on the DEIR the impact of the Project will be to bring 2,400 new employees to the area many of which will be hoping to live close to work. In fact, employees living close to work is the key to the DEIR's very analysis of Transportation impacts because, in the DEIR's theory, those employees will be commuting by bicycle or municipal transit. This obviously leaves the multi-pronged dilemma, unanswered or even analyzed in the DEIR as to (i) how the loss of 974 residential units will impact the ability of the City to meet its housing allocation obligation; and (ii) what impact, if any, will the influx of 2,400 new employees have on the housing market in the City and surrounding areas. These factors need to be analyzed and evaluated to determine the impacts of the Project on housing. There DEIR fails to do so.

O8-15 Continued

There is some indication that the DEIR recognizes the dilemma which it purports to solve by arriving at the inexplicable conclusion that: "Rather than increase population growth in the City, it is anticipated that the employment growth would be filled by existing residents of the City." This statement, which essentially forms the foundation of the DEIR's conclusion that the Project will have no impact on housing, is almost certainly false. We have not had the time or opportunity to study this issue but unless there are 2,400 souls in Santa Clarita qualified and waiting to work in the film production industry, we believe that the new jobs will not be "filled by existing residents". Rather, it is almost certain that these new jobs will be filled by new residents or employees who live outside the City but want to relocate closer to work. At a minimum, the DEIR needs to provide the basis for its conclusion that "existing residents" will be lining up to work at the new Project. Further, if that is the basis for the finding, what, if any program or incentive will be attached as a mitigation measure or a condition of approval to even promote the hiring of existing residents, if the DEIR conclusion is complete nonsense and renders the entire Population and Housing analysis of the DEIR inadequate.

O8-16

4.14 Transportation

The conclusion of the DEIR that there are no significant Transportation impacts, on its face, is ridiculous. How is it even possible to conclude that adding a project of this magnitude, with parking for 2,400 vehicles (not to mention the traffic for support services, deliveries, etc.), located along an already congested area will **have no significant environmental impact without the imposition of any mitigation measures?** The answer is obviously that it will have significant impacts on the transportation environment. The only way to reach the contrary conclusion of the

O8-17

[3] There is an internal inconsistency in the DEIR as to whether the current land use designation of the Project Site will allow 974 or 924 new dwelling units. Regardless of the number, the concept is the same.

DEIR is to ignore the reality of the situation and attempt to hide behind a wall of statistics and misguided assumptions. **O8-17 Continued**

Our detailed comments to the transportation section of the DEIR are generally set out in the attached May 19, 2023 review letter from Alex Tabrizi, PE, TE (a licensed traffic engineer). In his review letter, Mr. Tabrizi notes many questions and concerns with the transportation analysis of the DEIR. We incorporate each of his assessments and comments. We request that they be addressed in the Final EIR. **O8-18**

Nevertheless, in addition to Mr. Tabrizi's comments, we will address some of the problems with the DEIR Transportation analysis. The first issue is whether the Project will be conditioned on the completion of the necessary road improvements particularly the Dockweiler Extension project. It is clear both in analysis and anecdotally that without the Dockweiler Extension project and the other required traffic improvements, the Project will have a significant and potentially disastrous impact on the traffic circulation around the project and, in particular, for the residents of the Placerita Canyon Community. As noted earlier in these comments, a clarification of this position was requested at the May 16, 2023 Planning Commission meeting. This would seem to be a simple and fundamental question. The answers from both City staff and the EIR traffic consultant were far from clear and leave the status of the traffic improvements in relation to the commencement of operations on the Project, unclear. This simple question, which is critical to the Placerita Canyon Community and should be critical to the City. If the answer is that the commencement of business operations on the Project Site is contingent on the completion of the required traffic improvements (most particularly the Dockweiler project), then there will be substantially less questions and comments on the Transportation analysis. If, however, the Project is not contingent on those improvements, the transportation analysis is fatally flawed and completely useless to the City in making the ultimate determination. **O8-19**

We also note that the DEIR finding of "no impacts" is inconsistent with the traffic study on which the analysis is entirely based. Table 16 of the traffic study is a chart of existing Levels of Service potentially impacted by Project traffic. As noted in the attached Tabrizi letter, we question and/or disagree with the data and methodology used to create this table and support the DEIR Transportation conclusion. However, taking Table 16 on its face, there the Project will create a significant impact on the intersection of Railroad and 13th Street by dropping the Level of Service to D. This is the intersection through which traffic from the Placerita Canyon Community will travel and, as set out in the traffic study, there will be a significant impact. That finding alone should trigger a response in the DEIR to consider and impose mitigation measures to eliminate that impact. Instead, the DEIR simply ignores it. **O8-20**

Our concern is that the completion of the Dockweiler Extension improvements are not a condition of commencing business operations for the Project. That concern is based on (i) the lack of clarity within the DEIR itself; (ii) the finding that there is no significant impact to **O8-21**

transportation; (iii) because of the finding in (iv) there are **no traffic mitigation measures** set out in the EIR; (v) the failure of City staff and the EIR traffic consultant to give a straight answer to a simple question at the recent Planning Commission meeting; and (vi) changes made to the DEIR regarding who bears the responsibility for traffic improvements which were made as the insistence of the developer and lead to the conclusion that it has no intention of slowing down if the City does not complete the required improvements.[4]

O8-21 Continued

We also must question the conclusion of DEIR that the Project will have no significant impact, without any mitigation measures, on emergency evacuation. We will address that concern in more detail in the Wildfire section below. It is significant and obvious that the addition of the Project will dramatically and potentially fatally, lower the evacuation time for the Placerita Canyon Community including the many horses living in an equestrian-oriented community.

O8-22

We also question the degree of analysis that went into rejecting the idea of a traffic circle. It seems that the concept, which PCPOA finds interesting and promising, is now being rejected out of hand. We believe that a proper analysis could conclude that the traffic circle reduces the traffic impacts for both day to day traffic and, more importantly, for emergency evacuation.

O8-23

4.17 Wildfire

The most critical aspect of an environmental analysis for the Project should have been its impact on the safety of the surrounding community. Specifically, as we have noted repeatedly, the Project is located at the sole emergency exit point for the Placerita Canyon Community.[5] Under current conditions, the evacuation time for the Community is approximately 2.5 hours. We believe that estimate is low because it does not consider the number of horses that will need to be evacuated from the "equestrian-oriented" Community.

O8-24

As with Transportation, we have provided comments from an expert in the field, former Cal Fire Chief, Rob Lewin. Mr. Lewin has devoted his adult life to fire safety. With his work in San Luis Obispo and Santa Barbara Counties, Chief Lewin has a valuable reservoir of expertise regarding all aspects of wildfires of the type that inevitably threaten the Project area. We incorporate Mr. Lewin's comments into this letter but will, nevertheless, highlight some of the particularly egregious analytical failures of the EIR he observed.

O8-25

[4] We note that the charts provided by the traffic study carry a footnote that certain Dockweiler intersections will be "constructed by the Project." We fail to see any requirements or mitigation measures in the DEIR requiring the construction any intersections by the Project. If, as it seems, that was the basis for the traffic study then either those measures need to be imposed or the traffic study redone.

[5] There is a second potential exit point for some residents, but it is subject to physical and regulatory limitations. Moreover, given the configuration of Community with respect to historic fire patterns, the second potential exit is very likely to be toward the fire.

First, we note that most of the analysis of the DEIR wildfire discussion is focused on the safety and evacuation of the Project itself. Given that (i) the Project is located adjacent to escape routes without much immediate concern for evacuation bottlenecks; and (ii) the Project, unlike many of the adjacent homes, will be constructed under today's Fire Code standards, it is not surprising that the conclusion of the DEIR is that there will be no significant wildfire impact.

The DEIR, however, fails miserably to adequately consider the potential impacts on the Placerita Canyon Community. The most glaring example is that the Wildfire analysis, which is based entirely on the Dudek Fire Protection Study, relies entirely on the Gibson traffic study for its analysis of the evacuation patterns and timing in and around the project. We note that even though the Fire Protection Study references an evacuation analysis, it performs none. More critical, however, is the fact that the Gibson traffic study **failed to perform any analysis of the evacuation time for Placerita Canyon except with the completion of the Dockweiler improvements.** Table 24A provides the data for current evacuation times from Placerita Canyon. According the Table 24A, which did not take into account livestock removal, current evacuation time for Placerita Canyon is 2.6 hours. Table 24B purports to be the "after" condition in which evacuation times are reduced to 1.5 hours. However, Table 24B assumes that the Dockweiler improvements are complete. The comparison of these two tables renders both the Transportation analysis and the Wildfire analysis inadequate and in fact virtually useless in analyzing Project impacts.

O8-25
Continued

Unless the Project is going to be conditioned on the completion of Dockweiler, the DEIR must study the evacuation time from Placerita Canyon with the Project in full operation and without the Dockweiler improvements. Failing to do so leaves the City in the position of making a decision without the very information which an EIR is intended to provide. The most important question to be asked and answered is how much additional evacuation delay for Placerita will occur upon completion of the Project and without the Dockweiler extension. That is the only sure situation that will exist is the Project is approved and the one issue that must be addressed to determine potential Project impacts. The failure of the DEIR to do so is dumbfounding and renders the DEIR fatally flawed as to what is arguably the most important issue to be addressed; the safety of the Placerita Canyon Community. Unless and until that analysis is performed and made public for comment, the EIR for this Project cannot be certified. Safety cannot be sacrificed for expediency and the PCPOA is committed to making sure its members and other residents of Placerita Canyon are protected. Because, based on inadequate analysis, the DEIR found no significant impacts to fire safety, **there are no mitigation measures addressing wildfire safety. For a project of this magnitude, adjacent to older residential development with limited access and located in an area where the question is not if there will be a wildfire but only when. It is a shocking and irresponsible failure in the DEIR to attach any mitigation conditions to the Project to protect the Placerita Canyon Community.**

O8-26

As Chief Lewin provides, a wildfire moves at 4.7 miles per hour and can advance more rapidly when the frequent Santa Ana winds are strong and the terrain dry. Given all these factors, it is obvious that, even under current conditions and evacuation times, the situation is perilous. Allowing the Project to be approved with mitigation measures addressing the potentially deadly impact on evacuation times is inexcusable and renders the DEIR fatally flawed. The City cannot let the presence of a new shiny object distract it from the primary function of government; protecting its citizens. O8-27

Finally, at least for this letter, one solution for the evacuation problem might be to create a new emergency egress point for the Placerita Canyon Community. A review of topographical maps seems to indicate that there is a potential for such emergency egress point through the adjacent Circle J development. This potential should have been evaluated as a potential mitigation measure for the Project's obvious impact on wildfire safety. It does not appear that such a route, or any alternative emergency route, was even considered. O8-28

5.0 Alternatives

The Alternative analysis of the DEIR is defective in that it fails to adequately balance the relative impacts and benefits of the competing alternatives. In large part, this is due to the deficiencies in remainder of the EIR analysis which basically finds no impacts other than Biological and Tribal resources. Starting from the premise of no Project impact, it's not surprising that the Alternatives discussion is woeful. If you start from the false proposition that the Project creates no impacts, you are not likely to come up with a better alternative. Curiously, despite deeming the Project to have no impact, the DEIR does reluctantly admit that a smaller project, Alternative 3, which would have even less impacts (although less than none is a difficult concept). In short, so long as the remainder of the DEIR is defective, the meager Alternatives analysis in the DEIR will remain inadequate. O8-29

We note one example. Saugus Speedway was "considered" as an alternative site. It was rejected on two grounds neither of which appear to be valid.

> *Similar to the Project Site, the property is relatively flat… In addition, this property is included on the City's inventory of sites suitable for housing development;* ***development of the Project on this site would affect the City's ability to meet the State's Regional Housing Needs Allocation requirement and may have a potentially significant impact on population and housing.*** *Therefore, in accordance with CEQA Guidelines Section 15126.6(f), this alternative was rejected from further consideration.* O8-30

It is very curious that the loss of housing stock is given as a reason to reject the Speedway, yet the loss of 974 housing units due to the Project was barely discussed and not considered as a

significant environmental impact. This inconsistency demonstrates that the DEIR analysis was defective as to Population and Housing, Alternatives, or both. O8-30 Continued

Conclusion

The DEIR fails to meet the required CEQA standards on several levels. As noted in this letter and the attached expert comments, there are significant impacts from the Project that would be apparent based on a project environmental analysis. Those impacts could then be addressed by mitigation measures or, if necessary, adoption of a statement of overriding considerations. For whatever reason, the DEIR reads like more like a preordained approval authored by the developer's public relations consultant rather than providing the analysis necessary to protect the citizens of Santa Clarita and, more specifically, the residents of Placerita Canyon. As noted, due to the inexplicable refusal of the City to grant additional time for public comment, we reserve the right to continue to provide and will be providing comments on the DEIR and final EIR until certification and the filing of a notice of determination. Nothing herein should be construed as a waiver of any of PCPOA's rights or remedies under applicable law. O8-31

We welcome any questions or comments. Please contact the undersigned or Jeff Hacker.

Very truly yours,

Mr. Russ Hand, President
PLACERITA CANYON PROPERTY OWNERS ASSOCIATION
PO Box 220301
Santa Clarita, CA 91322

Subject: **Shadowbox Studios Project Transportation Study & Parking Analysis Peer Review, City of Santa Clarita, California**

Dear Mr. Hand,

MAT Engineering, Inc. (Consultant) conducted a peer review of the transportation/traffic analysis and parking analysis study for the Shadowbox Studios project and provides the following perspectives.

The peer review evaluated the following documents:

- *Draft Transportation Assessment for Shadowbox Studios (Gibson Transportation Consulting, Inc., January 2023)*.
- *Shadowbox Studios Parking Analysis Form (Gibson Transportation Consulting, Inc., December 20, 2022); and*
- *Shadowbox Studios Land Use Alternatives Trip Generation Comparisons (Gibson Transportation Consulting, Inc.).*

O8-32

Project Description:

As described in the Transportation Study:

- **Project Location:** In total, the Project Site is approximately 95.2 acres over multiple contiguous parcels; approximately 72 acres of the site will be developed and approximately 23.2 acres will remain undeveloped. The Project Site is bounded by vacant land to the north, vacant land and residential uses to the east, 12th Street and 13th Street to the south, and Railroad Avenue, the railroad and Arch Street to the west.

- **Existing Land Uses:** The project site is currently vacant.

- **Project Land Uses:** The Project includes the development of 476,000 square feet (sf) of stage area, 608,500 sf of studio support (including 37,500 sf of catering space), and 210,000 sf of production office. Base camp areas, a parking structure, and potential back lot space will also be provided. The Project would be constructed continuously in one phase and be completed by 2026

- **Previous Approval:** One previous proposal for this site under a different development group would have constructed 310 single-family residential units. This proposal was being processed by the City and a Draft Environmental Impact Report was pending release to the public when the property was acquired, and the full purpose film studio was proposed.

- **Project Parking:** The Project would provide up to 2,468 vehicle parking spaces in one five-level parking structure accommodating 1,070 parking spaces and three surface parking lots accommodating an additional 1,398 spaces (including parking for electric vehicles). Included in the 2,468 on-campus parking spaces, 296 parking spaces for electric vehicles would be provided, as would 56 accessible spaces compliant with the Americans with Disabilities Act (ADA). The Project would also provide 170 bicycle parking spaces (146 long-term and 24 short-term) for Project uses. Chapter 17.53 of the City of Santa Clarita Municipal Code sets forth property development standards. The standards set a height limit of 35 feet which may be increased to a maximum of 45 feet at the discretion of the director. The project parking structure and buildings appear to exceed these standards.

- **Project Vehicular Access:** Primary access to the Project Site is proposed via two driveways on 13th Street east of Railroad Avenue. Secondary access is provided via one driveway on 12th Street (Gate 3 Driveway east of Arch Street). Internal circulation will be provided by on-campus loop roads that deliver all campus traffic to/from the three proposed driveways. Similar to the previously approved residential project on the site, the Project Site will be served by the proposed but yet to be constructed Dockweiler Drive Extension Project (DDEP), which is claimed would improve access to/from the south. The Shadowbox Project proposes to signalize Arch Street & 13th Street & Project Driveway #1 & Project Driveway #2 and locate two driveways at this intersection: Gate 1 Driveway from the north leg and Gate 2 Driveway from the east leg. Arch Street, and possibly a portion of 13th Street, may be renamed Dockweiler Drive with completion of the DDEP. All three driveways would include security checkpoints for vehicles and pedestrians that would limit access to the facility to approved employees and visitors.

O8-32
Continued

Transportation Assessment for Shadowbox Studios (Gibson Transportation Consulting, Inc., January 2023) Review Assessments:

Assessment 1:

Related projects: The analysis assumes an evaluation of traffic to be added by 36 background and cumulative projects. The trip generation statistics are provided in Table 5 and the locations are provided Figure 7. The analysis fails to include an exhibit or data showing the magnitude of trips (trip assignment) added to each movement of the study intersections by these cumulative and background projects. **O8-33**

Assessment 2:

Table 6, Project Trip Generation: Trip generation is a fundamental basis for evaluating traffic conditions and is typically based on the rates for various land uses as published by the Institute of Transportation Engineers (ITE) manual. For unique land uses, the trip generation can be estimated using study of similar facilitates. The trip generation for the project appears to be based on empirical rates for studio land uses in the Los Angeles region. To demonstrate the source of data and how the studied sites compare in nature to the proposed project, more information and details on the studied locations and collected data that was used for the study must be provided. Otherwise, there is no basis for these opinions or conclusions. **O8-34**

The trip generation of similar uses from Los Angeles, a denser and more urban area, seems to reflect higher use of public transportation and other modes of transport, resulting in a lower trip generation estimate for a site in Santa Clarita. The only public transportation available in Santa Clarita is the local bus system and Metrolink primarily to downtown Los Angeles.

Furthermore, the trip generation contained in the EIR breaks down the uses into three categories with a trip rate for each use (stage, support, and production office). The EIR does not indicate how the breakdown data was obtained. Was it from the trip survey of similar studios?

Assessment 3:

Table 6, Project Trip Generation: The draft EIR does not indicate how the trip generation from the studies was considered or aretypical operations for the land use. How does this trip generation fluctuate throughout the day? What is the project's trip generation for mid-day, later in the evening or weekend conditions? **O8-35**

Assessment 4:

Page 37, Project Parking: A 20 percent reduction in the parking for the site seems to be assumed for the Jobs Creation Overlay Zone (JCOZ). Considering the unique nature of the land uses, does this reduction still apply to the project and, if so, why? **O8-36**

Assessment 5:

Level of Service Analysis Scenarios: The study evaluates existing conditions and project opening year conditions. Considering the significance of the proposed project and the magnitude and nature of the project trips, addition of a long-range conditions analysis is appropriate to evaluate the traffic conditions at full area buildout. **O8-37**

Assessment 6:

State Highway Facilities: Since the project might be considered regionally significant, which we understand there was some comment to that effect, Caltrans should be consulted or involved in development of the scope and review of the traffic study There is on indication that Caltrans was consulted. **O8-38**

Assessment 7:

Page 48, CEQA Impact Analysis & VMT: Based on the VMT analysis, the project is stated to have a home-based work VMT of 14.0 compared to the Citywide impact threshold of 15.7. Is the 15.7 figure, 15% below the City's average, or is it the City average? Based on the threshold on page 47 of the report, projects need to have a VMT of 15% or more below the existing City-wide average to have a non-significant VMT impact.

In Table 10, the VMT impact threshold appears to be listed as 14.0 which is different than the 15.7 mentioned in the text. **O8-39**

Footnote C on Table 10 appears to list the City average as 15.7 for year 2020 and 11.7 for year 2040. Hence, the project VMT of 14.0 might not be 15% or more below the City average, indicating a significant VMT impact under CEQA. The data seems to indicate the threshold to be 13.4 (15.7 X 0.85 = 13.34) which is below the project's VMT of 14.0.

Additionally, per the City of Santa Clarita Transportation Analysis Updates (Fehr & Peers, May 19, 2020), the baseline home-based work VMT for the City is listed as 18.4 for year 2020 and 13.5 for year 2040. **O8-40**

Assessment 8:

Level of Service Analysis Time Frames: The level of service study evaluates traffic conditions during the typical weekday from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM.

There are schools near the project site, including the Master's College, Hart High School, Placerita Junior High, Old Orchard Elementary School , and Peachland Elementary School. Also, there are well attended Churches in the Canyon and adjoining areas. Typically, when schools are nearby, the study needs to include an analysis of the school traffic and school arrival and release times. It is recommended the analysis time frames be expanded to include school and church l traffic. **O8-41**

As stated on Page 63 of the report, there are two schools located within 0.25 miles of the project site. There is no analysis of the impacts posed by the schools or churches in the Canyon.

Assessment 9:

Vehicular Queue at Driveways: The draft EIR does not indicate whether the empirical data collected at the sample Los Angeles sites include data on vehicular queues at the entrances Since the main access is on 13th Street, adequate storage capacity needs to be provided to keep vehicles from queuing outside the site and onto public right of way. This appears to be unaccounted for. **O8-42**

Assessment 10:

Queue & Level of Service Analysis: The draft EIR does not t assume existing traffic signal timing data based on information provided by the City and Caltrans If optimized traffic signal timing is used, the vehicular queues and level of service probably do not match existing field conditions. **O8-43**

Assessment 11:

Table 11, Project Trips on Ramp Intersections: The table indicates a small number of project trips added to the freeway ramps. Considering the project's peak hour trip generation (605 AM peak hour trips and 684 PM peak hour trips) and the regional access provided via State Route 14 and Interstate 5 Freeways, a larger portion of the project trips will be traveling thorough these ramp intersections. Especially, since the majority of the trips should be coming from outside the City and from the greater Los Angeles and nearby areas. It is recommended, the project trip distribution be revised to reflect a larger portion of project trips at the freeways. **O8-44**

Assessment 12:

Table 12, Vehicular Queues at Ramps: The draft EIR analysis indicates a vehicular queue of between 8 to 43 feet for the ramps during future without and with project conditions. The EIR is devoid of any information on how does this compare to the existing vehicular queues at the ramps/ For instance. are there currently minimal queues present at the ramps during the peak hours? The result showing 8 to 43 feet indicates a queue of one to two vehicles, which appears to be unsupported by the data . **O8-45**

Assessment 13:

Page 67, Project Trip Distribution: The draft EIR failed to provide the source and methodology for determination of project trip distribution assumptions. The report states that the distributions are based on patterns developed in the City's travel demand forecasting model. There is no way to tell whether the distribution for without and with the Dockweiler extension was considered. It cannot be determined if the applicant was using a select zone run with and without the roadway link in the model Further, there is no tie-in or correlation between this project and the construction of the Dockweiler extesnsion even though it appears that many of the assumptions and statistics are based on the actual construction of the Dockweiler extension. At a minimum, the project should not be built until the Dockweiler extension is completed. The draft EIR is devoid of any alternative or interim traffic or evacuation plans in the event the Dockweiler extension is not completed but this project approved and/or constructed. **O8-46**

Assessment 14:

Page 67, Study Intersections: It is recommended the study evaluate the access at Gate 3 to evaluate level of service operations at this driveway. As stated on Page 67, site access driveways should be included for analysis.

Also, the following intersections are recommended to be included in the study (they are not), since I-5 and the 14 Freeway provide regional access to the site from a number of ramp locations: **O8-47**

1. 12th Street / Project Access;
2. I-5 Southbound Ramps / Pico Canyon Road - Lyons Avenue;
3. Main Street / Newhall Avenue Roundabout;
4. I-5 Southbound Ramps / Magic Mountain Parkway;
5. I-5 Northbound Ramps / Magic Mountain Parkway;

6. Town Center Drive / Magic Mountain Parkway;
7. Valencia Boulevard / Magic Mountain Parkway;
8. I-5 Southbound Ramps / Valencia Boulevard;
9. I-5 Northbound Ramps / Valencia Boulevard;
10. Rockwell Canyon Road / Valencia Boulevard;
11. McBean Parkway / Valencia Boulevard;
12. I-5 Southbound Ramps / McBean Parkway;
13. I-5 Northbound Ramps / McBean Parkway;
14. Tournament Road / McBean Parkway;
15. Orchard Village Road / McBean Parkway; and
16. Orchard Village Road / Wiley Canyon Road.

O8-47
Continued

Assessment 15:

Page 68, Existing Traffic Count Data: Based on the report, the existing traffic counts were obtained from older studies from 2017 and 2019 not current counts. More recent traffic count data needs to be utilized. Alternatively, sampling of newer counts should be performed and compared to the data used in the study to ensure its validity.

O8-48

Assessment 16:

Page 68, Future Traffic Volumes: Based on the draft , the future traffic conditions volumes were obtained from the City's traffic model. However, the report did not provide clarification on how the 36 cumulative projects were accounted for in the traffic projections if the data was obtained from a traffic model. Were the cumulative project trips manually assigned to the roadway network?

O8-49

Assessment 17:

Table 16 and Table 17, Existing Plus Project Level of Service: Some of the delays appear to improve with the added trips from the project without explanation or basis. No information is provided on these improvements. Are they due to optimized traffic signal timing, etc.? **O8-50**

Assessment 18:

Table 17, Existing Plus Project Level of Service: A column needs to be added identifying the level of service impacts (yes/no), similar o Table 16. **O8-51**

Assessment 19:

Page 70, Existing Plus Project Level of Service: The report states that with the Railroad Crossing Upgrade, the level of service issue identified at the intersection of Railroad Avenue / 13th Street will be improved to acceptable LOS. If the Railroad Crossing Upgrade is not implemented for any reason, what improvements would be required to achieve acceptable LOS? Also, the report fails to adequately address traffic congestion at the crossing or incidents causing undue delay such as long trains, and the like. **O8-52**

Assessment 20:

Table 18 and 19, Future Conditions Level of Service: Based on the LOS table of results, during future without project conditions, some of the delays at the study intersections, such as Sierra Highway / Newhall Avenue and SR-14 Northbound Ramps / Newhall Avenue appear to improve compared to existing conditions. No information was provided on how these delays are less than existing/current conditions. If the intersection capacity is the same as existing conditions (no improvements assumed), with the additional traffic, the level of service and delay should generally get worse not better. **O8-53**

Assessment 21:

Page 72 & Table 19, Roundabout Analysis: No information on the methodology and software that was used for the roundabout analysis was provided. Considering the magnitude of the project's trip generation, a roundabout might not be suitable. This is also acknowledged on Page 81 pf the report while discussing the limits of the roundabout during emergency evacuation conditions. This limitation might also apply to the roundabout during typical operations due to high traffic volumes. **O8-54**

Assessment 22:

Level of Service Analysis: The study does not include an analysis of future conditions without the Dockweiler extension. It is recommended that a future year analysis without the extension be conducted and included to determine the potential impacts without the roadway extension in place. As stated in page 78 of the report, the implementation of the Dockweiler extension depends on funding availability. That is another reason why these two projects should be linked together. **O8-55**

Assessment 23:

Level of Service Analysis: There is no evidence that he analysis for the 13th Street / Railroad Avenue accounts for the railroad crossing and frequency The railroad crossing limits the capacity of the intersection and results in additional delays which impact level of service and vehicular queues. **O8-56**

Assessment 24:

Dockweiler Extension: The report fails to provide a figure showing the alignment of the Dockweiler Drive extension and how it connects to Placentia Canyon Road. **O8-57**

Assessment 25:

Page 77, Improvement at the Bouquet Canyon Road / Newhall Ranch Road Intersection: The recommended prohibition of westbound U-turn's negatively affects access to the existing land uses and Starbucks located at the southeast corner of the intersection. **O8-58**

Assessment 26:

Page 77, Improvement at the Bouquet Canyon Road / Valencia Boulevard Intersection: Is the recommended addition of a fourth eastbound through lane feasible? There appears to be existing land uses that should prohibit additional pavement widening. **O8-59**

Assessment 27:

Page 78, Improvement at the Sierra Highway / SR-14 Southbound Ramps Intersection: Is the recommended improvement coordinated with Caltrans? There is no evidence that it is. At intersections that are controlled by Caltrans, the improvement would need to be reviewed and planned by Caltrans and might take a long process to implement. Hence, the improvements might not get built or at least not built for a number of years. This fact affects the traffic analysis and further reinforces the need for the project to be linked to the construction of improvements. **O8-60**

Assessment 28:

Page 78, Improvement at the SR-14 Northbound Ramps / Placerita Canyon Road Intersection: Is this recommended improvement also coordinated with Caltrans? At intersections that are controlled by Caltrans, the improvement would need to be reviewed and planned by Caltrans and might take a long process to implement. Hence, the improvements might not get built or at least not built for a number of years. **O8-61**

Assessment 29:

Emergency Access & Evacuation: All project access appears to be via the east property side on and around 12th Street or 13th Street. Considering the large number of persons expected on the site and the size of the site, a secondary/emergency access located on the west side of the site is appropriate. Otherwise, if there is an issue at 12th Street or 13th Street on the east side of the site, there are no other evacuation routes for the site. Emergency evacuation routes need to be analyzed and provided.

If the site had 2,468 parking spaces, there would be a large number of vehicles to evacuate from the site during an emergency condition. **O8-62**

Furthermore, the evacuation analysis appears to depend on and assume on the Dockweiler Drive extension to be in place. As previously noted in Assessment 22, the implementation of this extension depends on funding availability. There are no alternative evacuation plans posed particularly if the Dockweiler extension is not constructed or timely constructed.

Assessment 30:

Figure 10, Project Trip Distribution: Some of the project traffic appears to be absorbed between study intersections, specifically traveling between intersections 7 and 8. There is no data or other evidence supporting this conclusion. **O8-63**

Assessment 31:

Figure 10, Project Trip Distribution: The analysis appears to assume more of the project trips traveling through the City and local streets than traveling to and from the freeways, especially the I-5 Freeway which provides great regional access. Is this a valid assumption considering the workers are mostly coming from outside of Santa Clarita? What percentage of the workers are expected to live in the surrounding neighborhoods? How has this been calculated or what is the basis for this assumption? A greater percentage of trips might need to be assigned to the freeway ramps to more accurately assess project traffic. More traffic should be assigned to the I-5 Freeway than the SR-14 Freeway. **O8-64**

Assessment 32:

Page 156, Construction Traffic: A table is lacking showing the expected trip generation of the construction phase which has the highest number of trips. Also, since trucks occupy more space than passenger vehicles, it is recommended the truck trips be converted to passenger car equivalents (PCE) using a factor of 2.0. This will assist the user in understanding the number of trips generated by the project construction phase and compare to project operations. **O8-65**

Shadowbox Studios Parking Analysis Form (Gibson Transportation Consulting, Inc., December 20, 2022) Review Assessments:

Assessment 33:

Table 1, Parking Demand Calculations: The parking analysis appears to base the parking demand for the studio-related uses on light manufacturing use. No explanation was provided on why this use is appropriate. It is recommended the parking be based on study of similar sites and studios. **O8-66**

Assessment 34:

Parking Demand Calculations: The parking analysis appears to assume shared parking conditions for the proposed uses. Since the food service parking rate is reduced to only account for employee parking, is a shared parking between the food service uses and the rest of the uses applicable? What is the basis for this comparison?

Also, shared parking can result in longer parking turnover times. Hence, parking spaces can be expected to be occupied for a longer than usual time, affecting parking demand. **O8-67**

Furthermore, what is the source for the time of day parking demand of the studio uses?

MAT Engineering Inc. appreciates the opportunity to provide this review. If you have any questions, please contact us at 949-344-1828 or at@matengineering.com.

ALEX TABRIZI, PE, TE

President

Alex Tabrizi, PE, TE is a licensed civil engineer and licensed traffic engineer in the State of California and serves as the founding president of MAT Engineering, Inc. Mr. Tabrizi has worked professionally in the field traffic engineering and transportation planning/engineering since 2003. He received his bachelors of science degree in civil engineering with an emphasis on structural engineering from the University of California, Irvine.

Mr. Tabrizi has extensive experience in providing transportation planning and engineering consulting services and expertise to a wide range of clients including private sector, land developers, public agencies, various districts of California Department of Transportation (Caltrans), and local governments. Mr. Tabrizi has completed and supervised preparation of hundreds of complex transportation planning and parking demand/utilization studies with successful track record in providing innovative, cost-effective and practical technical consulting services and solutions for politically sensitive, complex, and unique projects involving numerous stakeholders and requiring to meet accelerated project schedules.

As an Expert consultant to the California Board for Professional Engineers, Land Surveyors, and Geologists, Mr. Tabrizi assists the Board with development, maintenance, and validation of material for the Board's professional licensing examinations.

Mr. Tabrizi is also a member of the Traffic Engineering Occupational Analysis Task Force assisting the State's Board of Engineers in determining descriptive information about the tasks performed by Traffic Engineers in the industry and the knowledge standards required to adequately perform those tasks.

Mr. Tabrizi has performed transportation planning studies dealing with various stages of project development, such as signal warrant analysis, circulation analysis, full traffic impact analysis, roundabout analysis and parking studies. He has prepared traffic flow visual simulations combining measured vehicular and pedestrian volumes with aerial imagery to show existing and future traffic circulation for public understanding and discussion. Mr. Tabrizi has also completed a number of transportation engineering and roadway design projects ranging from preparing preliminary studies and reports such as Caltrans Project Reports (PR) and City street improvement concepts to final construction plans, specifications, and cost estimates for Caltrans highway improvement projects.

Mr. Tabrizi is knowledgeable in computer applications for transportation engineering and planning, including, AutoCAD, Microstation with InRoads, Traffix, HCS, Synchro/ SimTraffic, and aaSIDRA.

Subject: Response to NOA for Shadowbox Studios Project Draft EIR

Dear Ms. Iverson,

Thank you for the opportunity to comment on the Draft EIR for the proposed Shadowbox Studios project.

Introduction

The focus of my limited review of the Draft EIR is on fire safety and the impacts of a wildfire burning in the Wildland Urban Interface (WUI) that could threaten the Shadowbox Studios project (Project). Most importantly, I focused on the impacts the project will have on exasperating the wildland fire threat to the neighboring communities, specifically Placerita Canyon and Circle J neighborhoods.

The Placerita Canyon and Circle J communities were developed prior to the rigorous WUI fire codes that are now in place and will be required of this Project. The most significant impact to the communities is the Project's compounding threat to these already inadequate evacuation routes and the extreme threat from wildfire which continues to get worse. These communities have limited egress during an evacuation, there are long dead-end roads, and the structures are not built with hardening to prevent flame impingement and ember intrusion. **O8-68**

In section 4.8 Hazards and Hazardous Materials, the EIR asks; *Would the Project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?* And then determines that the impacts to be less than significant and therefore, no mitigations measures are required. I believe that this determination requires further analysis of the Project's neighboring communities of Placerita Canyon and Circle J. Upon further analysis, I am confident it will be determined that the impact on the community will be significant and will require mitigations including requiring the Dockweiler Extension be completed as part of the first phase of the project. Additionally, further analysis should be done to identify possible road interconnections that will reduce the long evacuation time and reduce the dead-end road situation within the communities. **O8-69**

As part of the review, I am including a fire behavior analysis completed by Tim Chavez who is a fully qualified Fire Behavior Analysist with decades of experience modeling fire behavior on California wildfires. His study further corroborates, along with the fire behavior analysis contained in the EIR, the significant threat that wildfires pose to the neighborhoods adjoining this project. His report is attached to this letter. **O8-70**

Historical Fires

The Santa Clarita area is recognized by California's seasoned wildland fire commanders as an area for large, destructive and deadly fires. Historically, wildland fires most often occur in the **O8-71**

same areas over and over. One can look back at history and see countless major fires that have burned in and around the Santa Clarita Valley. Listed are some of the significant fires that have occurred since 1960.[1]

- New Hall Fire 1962 – 8,583 acres, 15 structures destroyed
- Clampitt Fire 1970 -115,537 acres, 86 homes destroyed, 4 fatalities
- Agua Dulce Fire 1970 – 21,756 acres
- Sayre Fire 2008 – 11,221 acres, 604 structures destroyed
- Buckweed Fire 2007 – 37,804 acres, 63 structures destroyed
- Ranch Fire 2007 – 41,523 acres,10 structures destroyed
- Sand Fire 2016 - 41,432 acres, 18 homes destroyed, 2 fatalities
- Rye Fire 2017– 6,049 acres, 6 structures destroyed

The EIR identifies that the average interval between wildfires within 5 miles of the project site is less than 1 year. This is a very high fire frequency rate.

The fire history, as corroborated by the EIR, clearly indicates that destructive wildfires will continue to threaten the Project area and the neighboring communities of Placerita Canyon and Circle J.

Sanatorium Burns, Patients Given Aid

Gene Autry's Melody Ranch Left in Ruins

O8-71
Continued

Based on an analysis of the fire history data set, specifically, the years in which the fires burned, the average interval between wildfires within 5 miles of the Project site was calculated to be less than 1 year with intervals ranging between 0 (multiple fires in the same year) to 8 years. Based on the analysis, it is expected that there will be wildland fires within 5 miles of the Project site at least every 8 years and on average, every year, as observed in the fire history record. Based on fire history, wildfire risk for the Project site is associated primarily with a Santa Ana wind-driven wildfire burning or spotting on-site from the north or east, although a fire approaching from the south during more typical on-shore weather patterns is possible. The proximity of the Project to large expanses of open space to the east (Quigley Canyon Open Space) and southeast (Placerita Canyon), has the potential to funnel Santa Ana winds, thereby increasing local wind speeds and increasing wildfire hazard in the Project vicinity. – Appendix N, page 18

https://scvhistory.com/scvhistory/ap0837.htm

Fire Behavior Analysis

O8-72

On page 41 in Appendix N the fire behavior analysis is focused on the impacts of a wildfire on the Project site and not on the neighboring communities. Therefore, inference must be applied to understand the impacts a wildfire will have on the neighboring communities and then a determination on what impact a wildfire will have. This is important and must be considered to determine what improvements this project should include that will mitigate what should be significant impacts on the neighboring community.

As the EIR correctly states this project is located and is surrounded by areas designated Very High Fire Hazard Severity Zone (VHFHSZ) by the State of California. This means that the wildland fire environment factors include steep and broken topography, volatile vegetation, and frequent weather conditions conducive to extreme fire behavior.

Further, the fire behavior analysis included in the EIR in Appendix N **does** accurately corroborate that extreme wildland fire behavior, usually under Santa Ana wind conditions, frequently occurs in the area around the Project. Because of these conditions the project is required to be built under the strict Wildland Urban

Melody Ranch - Newhall Fire

August 28, 1962 — Gene Autry's Melody Ranch movie town burns to the ground as flames engulf most of the hills surrounding the Santa Clarita Valley.

The first blaze broke out just after noon in Hasley Canyon, north of Castaic Junction. The second broke out an hour later near the Circle J Ranch between Newhall and Saugus. High winds whipped the flames into the most intense inferno anyone had ever seen.

When the smoke cleared three days later, 17,200 acres had been scorched and 15 structures and numerous out-buildings were lost. No one was killed, but the Western street at Melody Ranch was gone.

"I had always planned to erect a Western museum there," Autry remembered in 1995, "but priceless Indian relics and a collection of rare guns, including a set used by Billy the Kid, went up in smoke. Thank God, the ranch hands and all 14 of our horses were uninjured."

O8-71
Continued

Interface fire regulations required by the City of Santa Clarita and the State of California. Unfortunately, that same extreme fire behavior identified by the analysis also affects the neighboring communities in the same manner, except the residents of these older communities, having been developed decades ago, do not have the benefit of the current fire regulations for new developments and construction to protect them.

State of California Fire Hazard Severity Zone Map of the Project Area

O8-72
Continued

Further evidence of the extreme fire behavior is included in the Fire Behavior Analysis attached to this letter completed by Fire Behavior Analyst Tim Chavez. He identifies that the fire rate of spread can be up to 5 mph and spot fires from burning firebrands can be expected to be prolific and frequent, regularly reaching 1500' ahead of the fire front, further increasing the fires rate of spread downwind. These are extreme fire behavior conditions that can be deadly.

With this Project, a fire threatening these communities will now be further impacted during an evacuation with the additional 2,400 employees that will increase traffic without requiring mitigations prior to construction.

Evacuation

While the EIR correctly demonstrates that the evacuation of the Project site itself will be adequately addressed, it also demonstrates the unacceptable inadequacy of a rapid evacuation of the neighboring communities, requiring 2.6 hours to fully evacuate. This is compounded by extreme fire behavior conditions that can spread a fire at 4.7 mph.

The EIR contains a comprehensive evacuation study by Gibson Transportation Consulting. The study correctly includes not just the evacuation of the Project, it also includes the evacuation of the "evacuation shed" bounded by the area south of Parvin Drive on the north, Quigley Canyon Road and Melody Movie Ranch on the east, the Master's University campus and Placerita Canyon Road on the south, and Railroad Avenue on the west.

O8-73

It could be argued that the evacuation shed should include the neighborhood all the way to the Sierra Highway as that area also requires two means of egress, thus sending those residents west on Placerita Canyon Rd.

The methodology utilized in the Wildfire Section 4.17 states that, "*The analysis also considered the modifications to the Dockweiler Drive Extension Project…"* It is clear from the traffic study that evacuation times are cut in half for the Project's neighboring communities **only if** the Dockweiler Drive extension is completed. Yet throughout the EIR it is always referred to as a "future project."

The mitigation identified by the Evacuation Traffic Study, **but not included as a requirement** of this Project is the Dockweiler Drive extension or corridor. As stated, it is identified as a **future**

> *Traffic Study Conclusion – page 5*
>
> *As shown in Figure 6, the improved Dockweiler Corridor would facilitate the evacuation of the Placerita Canyon Area by reducing the evacuation congestion period at Arch Street & 12th Street & Dockweiler Drive from 2.6 hours under Existing Conditions to 2.2 hours under Future with Project (Roundabout) Conditions and 1.5 hours under Future with Project (Traffic Signal) Conditions. Further, average travel times through the Dockweiler Corridor would be greatly reduced for vehicles evacuating the Placerita Canyon Area, from 27 minutes under Existing Conditions to under 18 minutes under Future with Project (Roundabout) Conditions and under 16 minutes in the Future with Project (Traffic Signal) Conditions. Thus, the traffic signal intersection design would provide for the most efficient traffic operations under an evacuation scenario.*

O8-74

project. The Dockweiler Drive extension should be required as the first phase of this Project and completed before the impacts of the Project are realized.

Other mitigations that should be considered to improve emergency evacuation of the neighboring communities should be the identification of interconnection routes that might provide egress from a neighborhood to safety. This could include connecting the Circle J neighborhood to the Placerita Canyon neighborhood, thus reducing the existing long dead-end road situations.

Large Animal Evacuation

O8-75

There is no mention of large animal evacuation in the EIR, including in the evacuation traffic study. It is well understood that evacuation of horses and other large animals takes time, specialized equipment and training. Large animal evacuation teams coming in during an evacuation with trailers and the time and congestion caused from loading up and transporting horse trailers all will be an impact. It is also understood that many people faced with immediate evacuation will delay or refuse to evacuate if they are unable to evacuate their pets, including horses and other animals. The Project's neighboring communities are locations where many people have horses and other livestock. It would be prudent to include in the evacuation traffic study the impacts of large animal evacuation.

Sand Fire horse evacuation - photo by Sydney Croasmun

Emergency Access

Transportation Section 4.14, page 20 Threshold 4.14(d) Would the Project result in inadequate emergency access?

Emergency access or ingress is the ability for first responders to be able to access a site and a neighborhood. The L.A. County Fire target response times are 8 minutes for suburban areas. This is currently achievable to the communities during normal travel conditions and validated by the traffic study. The evacuation traffic study does recognize that access to the area would be prohibited during an emergency evacuation conditions. The important question to ask **is not**

> *The Existing Conditions volumes utilize the existing afternoon peak hour volumes for north-south traffic on Railroad Avenue and assume that, under emergency evacuation conditions, the traffic on Railroad Avenue and Dockweiler Drive would be prohibited from entering the area. - page 3 transportation study*

included in this study, *during an evacuation of the Placerita Canyon and Circle J communities will the fire department be able to make access into the communities as people are fleeing from an emergency?* Further, *is that situation further impacted by this Project?*

O8-76

Pre-Construction

The fire code requires that prior to construction a project must complete fire access. Further L.A. County Fire recommends in the EIR *that prior to bringing lumber or combustible materials onto the project site, improvements within the active development area shall be in place, including utilities, operable fire hydrants, an approved, temporary roadway surface, and fuel modification zones established.*

While the code applies to new construction, specifically this Project, it demonstrates the importance of fire department access before construction when combustible materials are underway.

A nexus should be made that while the roads in the surrounding communities are established, they have long been viewed as inadequate compared to if they had been built to modern fire safety regulations. This will be further exasperated by the significant addition of the 2,400 employees of the Shadow Studio who will further add to emergency evacuation impacts to the egress routes during an emergency. Therefore, it would be an important mitigation that prior to construction of the Project, installation of the Dockweiler Extension be completed to significantly improve the evacuation rate of the neighboring communities.

> Fire Code Chapter 501.4 Timing of Installation
>
> Where fire apparatus access roads or a water supply for fire protection are required to be installed, such protection shall be installed and made serviceable prior to and during the time of construction except where approved alternative methods of protection are provided. Temporary street signs shall be installed at each street intersection where construction of new roadways allows passage by vehicles in accordance with Section 505.2.

O8-77

Round-About

The evacuation traffic study determined that a signaled intersection at the future intersection of Dockweiler Drive and 12th Street would improve evacuation times for the average vehicle evacuating from 22 minutes to 16 minutes for a signaled intersection and to 18 minutes for a

O8-78

Resolute Associates LLC
BRINGING ACTION TO VISION
1332 Pismo Street, San Luis Obispo, CA 93401

roundabout. Therefore, it suggests that a signaled intersection is superior to a roundabout. While the models may indicate this, anecdotal evidence suggests that during an evacuation a signaled intersection that is not controlled by a traffic officer may well cause a logjam as vehicles wait for the signal to change allowing them to exit the dangerous evacuation area. A roundabout will provide for a continued flow of vehicles from all exits. It is suggested that this concern be further reviewed.

O8-78
Continued

Conclusion

This Project will impact the ability for both the neighboring communities to quickly evacuate as well as simultaneously allow emergency responder ingress into the neighborhoods. Our analysis is that without the Dockweiler Drive extension installed as part of the first phase, the Project's impact on the communities is significant and the EIR should reflect that.

The report says a fire can spread 4.7 mph and that the Placerita Canyon residents will average 27 minutes to evacuate (however, it did not indicate what location they are evacuating to). If we consider a travel distance of 1 mile to evacuate by vehicle, this is about 2 mph. The Dockweiler Drive extension will reduce the evacuation time to 16 minutes or about 4 mph, and improvement of the average evacuation time by a vehicle to twice as fast, still not as fast as the potential spread of a Santa Ana driven wildfire, but a significant improvement and could clearly improve survivability during an evacuation. Are there other emergency egress routes that could also improve survivability during a fast moving wildfire?

The following thresholds have all been "determined to be less than significant without mitigation:"

O8-79

- *Threshold 4.8(f): Would the Project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?*
- *Threshold 4.8(g): Would the Project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?*
- *Threshold 4.14(d): Would the Project result in inadequate emergency access?*
- *Threshold 4.17(a): Would the Project substantially impair an adopted emergency response plan or emergency evacuation plan?*
- *Threshold 4.17(b): Would the Project due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose Project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?*
- *Threshold 4.17(c): Would the Project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?*

These thresholds all rely on the Dockweiler Drive extension being part of the Project, yet it only is included as part of the Project as a future improvement. This is confusing as to when it will be in place. My analysis indicates that the Dockweiler Drive extension must be completed prior to the construction of the Project, otherwise some, or all, of the thresholds listed above are impacted by the Project and must require mitigation.

As part of the evacuation traffic study, we recommend that if it was not considered, that large animals be included as part of the study's modeling. **O8-80**

We also recommend a review of the determination of whether the Dockweiler Drive and 12th Street intersection could be more effective as a roundabout instead of a signaled intersection. **O8-81**

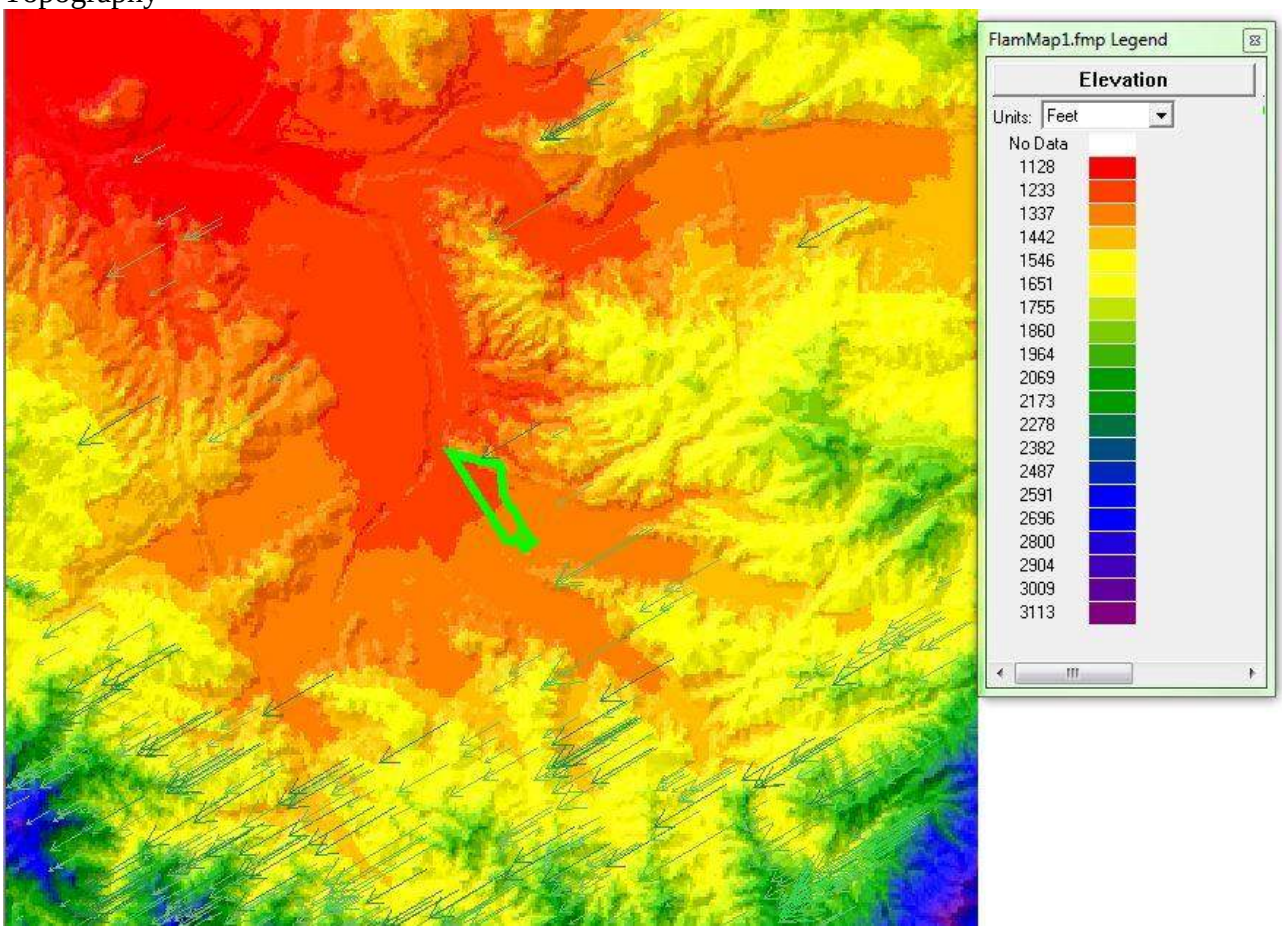
Attachment: Shadowbox Fire Behavior Analysis by Tim Chavez

Shadowbox Fire Behavior Analysis

Prepared by Tim Chavez, Fire Behavior Analyst
May 20, 2023

The Saugus-Newhall area of Southern California has unique and severe fire behavior conditions. Winds are strong almost every afternoon, and north winds along the I-5 corridor often occur in the spring and fall. Exceptionally strong Santa Ana winds occur in the fall and winter out of the north and northeast that can produce gusts stronger than 50 mph at times.

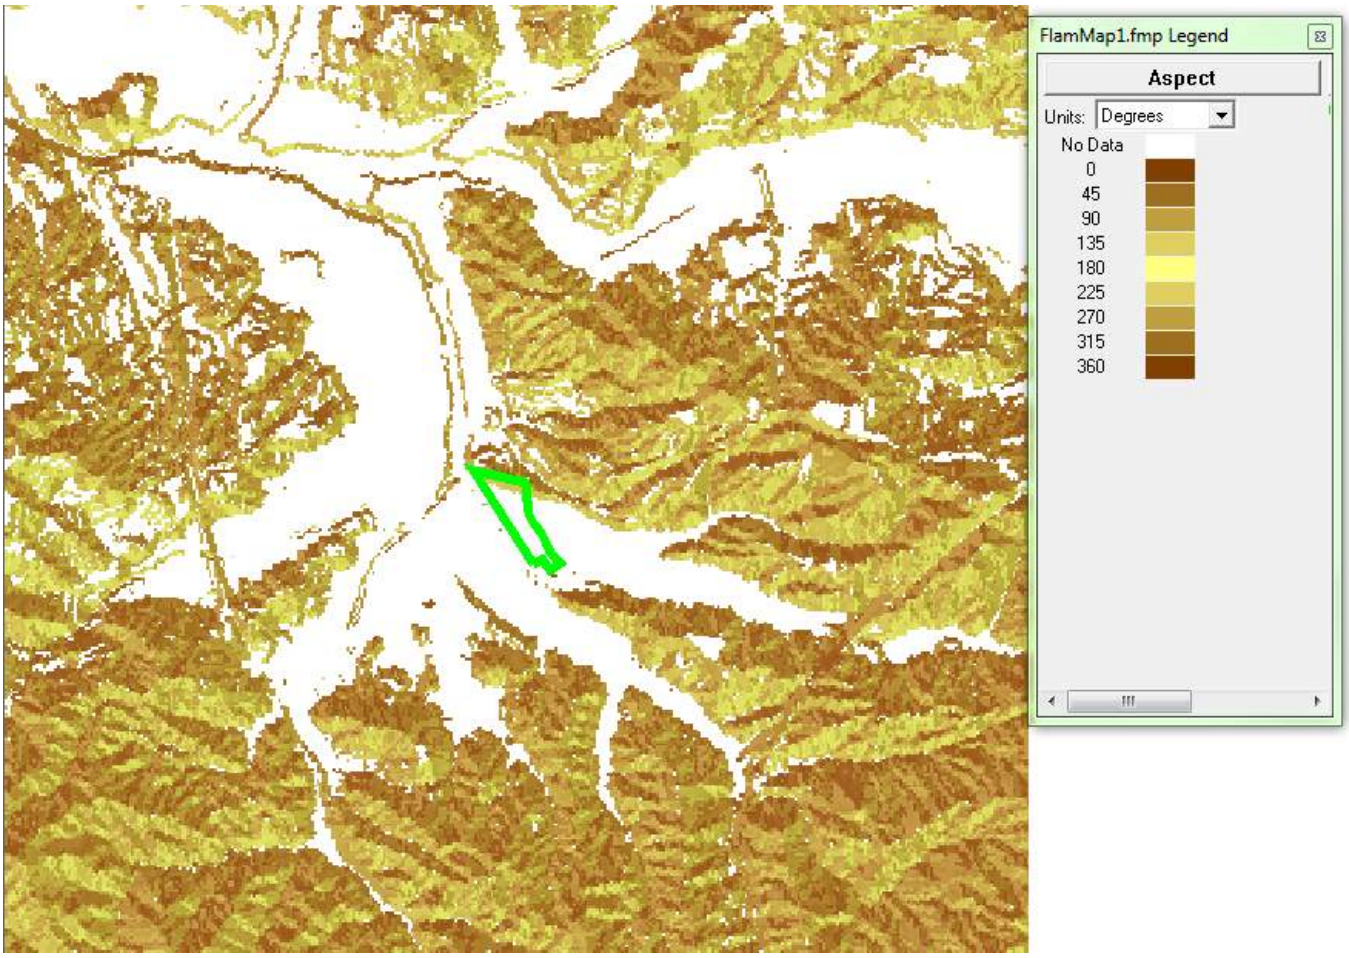
Topography



The terrain is heavily dissected with deep and steep canyons that are often oriented with the wind to produce spectacular rapid and intense fire spread.

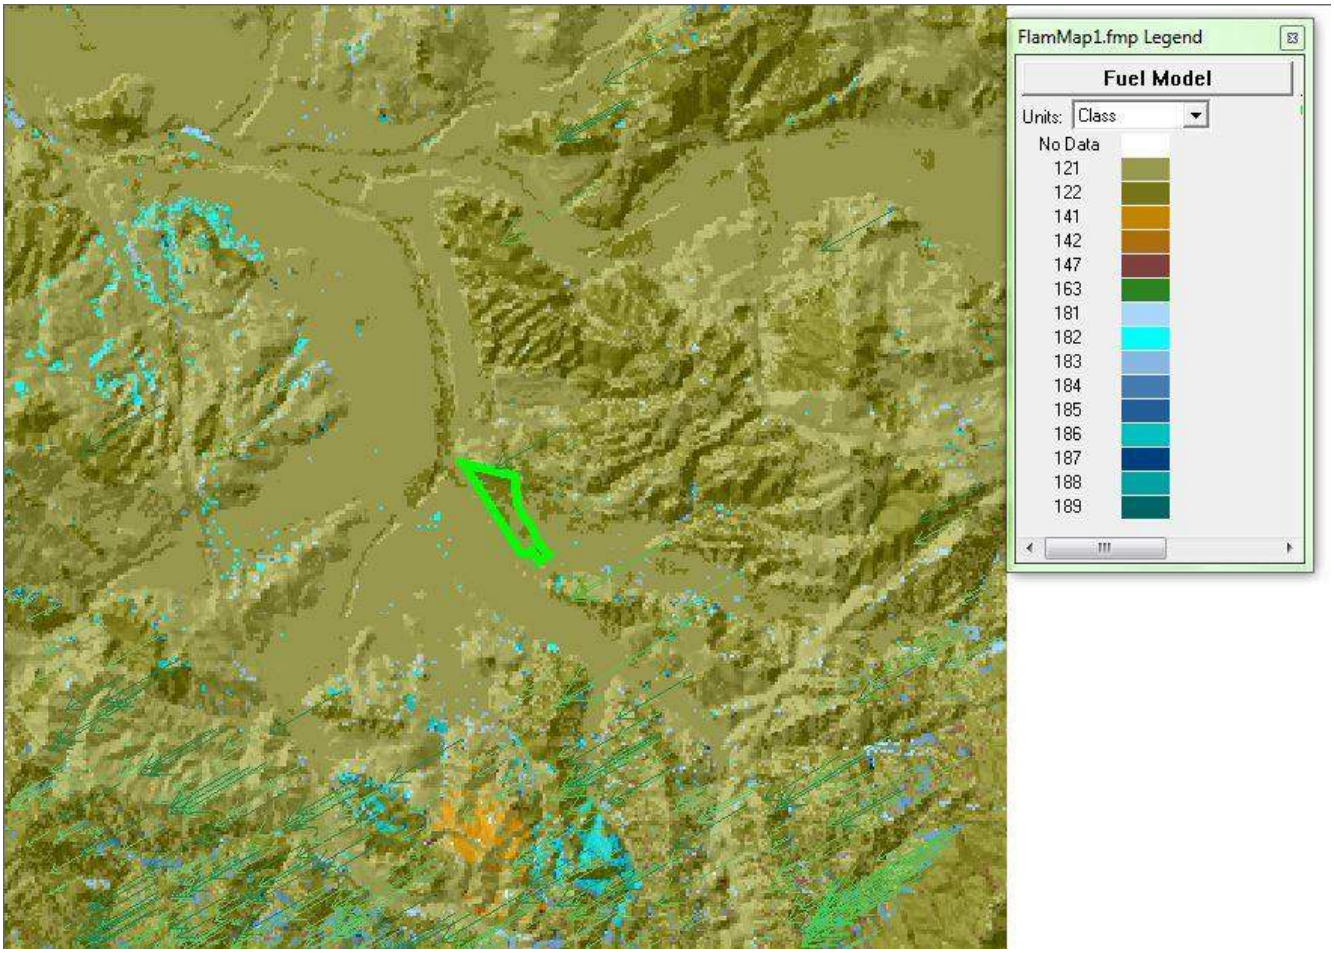
O8-82

O8-82
Continued



Aspect or the orientation of slopes in the area are predominantly facing northeast (45) or southwest (225).

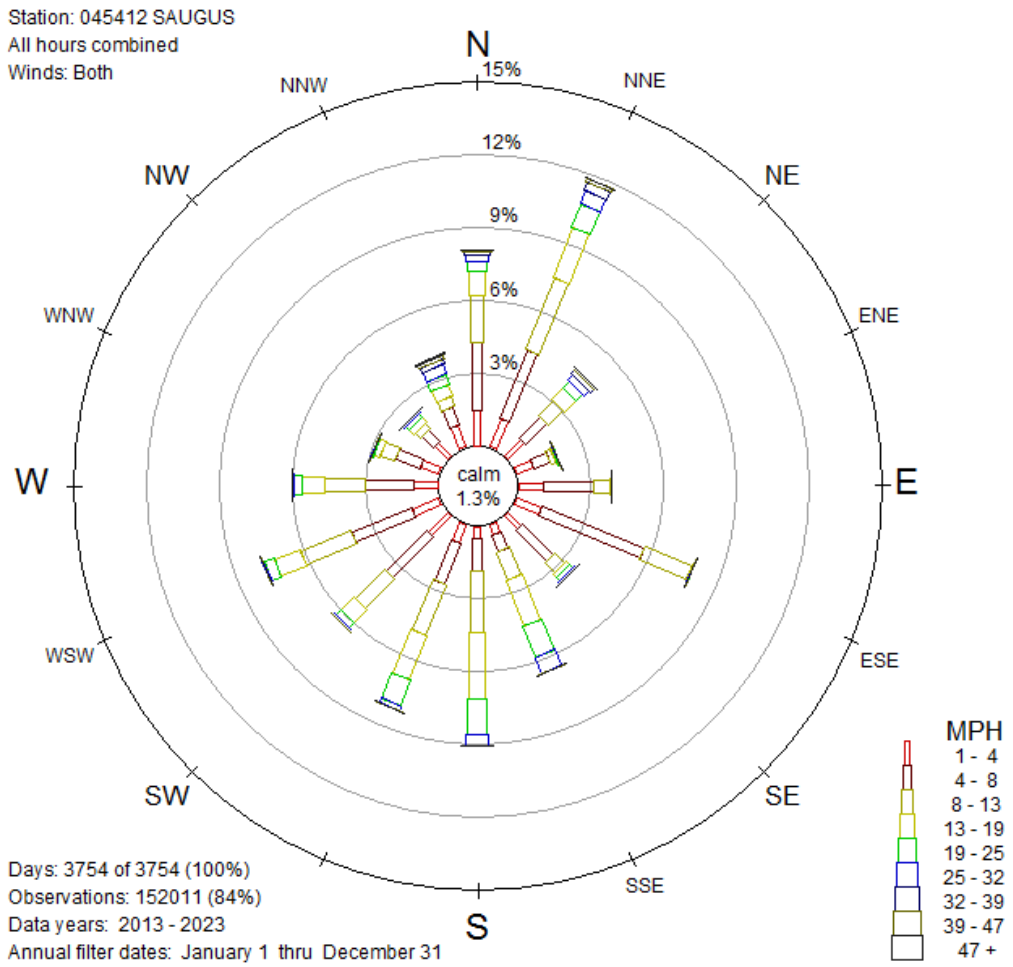
O8-82
Continued



Fuels in the area of the project are dominated by coastal sage scrub 2-4' in height, indicated in the map above as 121 or 122. Some oak woodland and heavier brush are minor components in the area. (Fuel Model numbers are from Scoot and Burgan 2005).

An analysis of the wind direction and speeds from 10 years of data at the Saugus Remote Automatic Weather Station presented as a wind rose shows the strongest winds are from the north-northeast at greater than 47 mph at times.

O8-82
Continued



Wind speeds and gusts can also be represented over the year from this data:

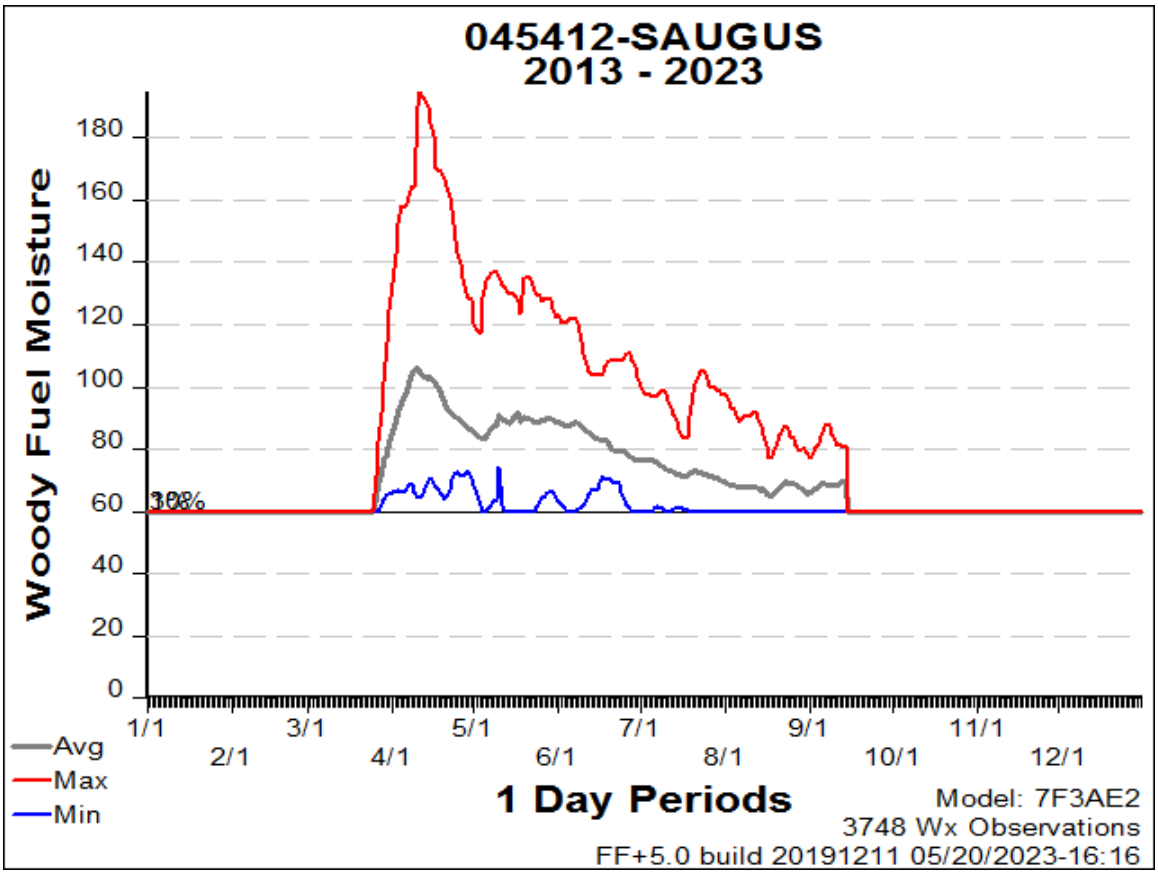
As shown in the time series graphics, the strongest winds, above the 90th percentile, occur from late September until April. The period from September until December is of greatest concern in terms of fire behavior because the live fuel moistures from the chaparral fuels are also at their lowest points. Grasses are also fully cured and are 100% available fuel. The combination of the two conditions leads to often explosive fire behavior.



Therefore the scenario of most concern is a late season wind driven fire originating from north and/or east of the Shadowbox location.

Geospatial fire behavior analysis of the resultant fire behavior in the area of the Shadowbox location is shown below.

Worst case scenario conditions:

Live fuel moisture 60% in chaparral fuels
Grasses fully cured
Dead fuel moisture fuel size 0-1/4"=3%,
1/4-1" =4%
1-3"=5%
slope steepness varies by terrain
wind speed= gusting to 65 mph (recorded gust at Saugus on 12/5/2017)

Flame lengths near 20-25' will emanate from the fuelbed directly to the north and east under any wind conditions greater than 25mph. As the fire approached the area, the rate of spread could be up to 200-400 chains/hour (2.5-5 mph). Warning time for evacuations would depend on early warning of an upwind fire start location and good location data of the fire front location (which is often lacking in the early stages of a fire).

Spot fires from burning firebrands can be expected to be prolific and frequent, regularly reaching 1500' ahead of the fire front, further increasing the fires rate of spread downwind.

FROM VISION TO ACTION

Experienced Fire Chief, Director and Consultant with a leadership and management style that supports and inspires excellence from others and promotes team solidarity. More than 15 years responding to disasters in leadership positions on Type 1 Incident Management Teams deployed up and down the State. Office of Emergency Management (OEM) Director with a demonstrated record of success managing large-scale projects and leading coordinated response efforts to complex disasters. Strategic thinker skilled at resolving problems, maintaining composure, and acting decisively and appropriately in crucial situations. Articulate, refined communicator with cooperative interpersonal skills and a high level of personal and professional integrity. Authored many articles and presented at numerous conferences.

KEY QUALIFICATIONS

Emergency Management: Extensive experience leading emergency operations for major fires, natural and human caused disasters and complex special projects. A recognized leader in emergency planning and operations.

Operations and Personnel Leadership: Adept with strategic planning and executive leadership. Astutely assess and resolve operational challenges with staffing and service.

Collaboration and Partnerships: Approach all issues to determine how they can have a regional benefit and make improvements to multiple communities and agencies.

Fiscal Management: Adept with budget planning, allocation, and accountability.

RECENT PROFESSIONAL EXPERIENCE

2019 – : ***Principal***
RESOLUTE ASSOCIATES LLC
Providing emergency management and strategic planning consulting. Completed numerous pragmatic planning documents and the training to support their implementation.

2016 – 2019: ***Director***
SANTA BARBARA COUNTY
OFFICE OF EMERGENCY MANAGEMENT | Santa Barbara, CA
Managed all Emergency Operations Center activations, including 12 occurrences with continuous operations spanning December 2017 to April 2018 for fire/debris-flow disaster response.

2010 – 2015: ***CAL FIRE / County Fire Chief***
CAL FIRE | San Luis Obispo County (SLO), CA
Lead a fire department with 21 fire stations, air tanker base, 12 inmate and CCC fire crews, dispatch center, training bureau, fleet management, fire prevention bureau.

Response to Comment No. O8-1

The comment states that PCPOA initially requested a 15-day extension of the public review period of the Draft EIR on April 19, 2023. A subsequent extension was requested on May 15, 2023, and again on May 16, 2023, at the Planning Commission hearing. The Planning Commission did not grant the extension, but the City has provided the following public review periods and opportunities for public input during the Shadowbox Studios EIR process:

- Publication and distribution of a Notice of Preparation (NOP) on March 28, 2022, notifying interested agencies, organizations, and persons that the City would be preparing an EIR for the Project and inviting comments on the scope and content of the EIR. The public review period for the NOP was from March 29, 2022, to April 28, 2022.
- Public scoping meeting held on April 21, 2022, at which the City accepted comments on the scope and content of the EIR.
- Publication and distribution of a Notice of Completion and a Notice of Availability of the Draft EIR on April 6, 2023, which notified interested agencies, organization, and persons that the City was accepting comments on the Draft EIR. The public review period for the Draft EIR began on April 6, 2023, and ended on May 22, 2023.
- Three Planning Commission meetings held on April 18, 2023, May 16, 2023, and June 20, 2023, to solicit comments from the public and the Planning Commission on the Draft EIR.

The public review process undertaken by the City for the Draft EIR fully complies with all requirements of CEQA and the CEQA Guidelines. Given the above, and based on direction provided by the City's Planning Commission, the Draft EIR review period was not extended.

In addition, the City received a request on April 19, 2023, for access to all documents referenced and incorporated by reference in the Draft EIR, and a subsequent formal Public Records request was created in the City's Resident Service Center. The City is given 10 calendar days to respond to the request. Due to the numerous and distinct records that were being requested, staff required additional time to compile, review, and provide the records responsive to the request. A response was sent to the requestor on May 1, 2023, notifying them of this requirement under the provision of Government Code 7922.535(b), which allows for an additional 14 calendar days to respond. All referenced documents, along with links to online documents that were available, were provided on May 15, 2023, closing the Public Records request.

CEQA and the CEQA Guidelines require a lead agency to make the Draft EIR and all documents incorporated by reference in the EIR available for public review. The City of Santa Clarita provided the Draft EIR, its appendices (Appendices A through O), and the documents incorporated by reference for public review during the entire review period, which extended from April 6, 2023, to May 22, 2023. Documents were made readily available on the City of Santa Clarita website

(see https://www.santa-clarita.com/city-hall/departments/community-development/planning and https://www.santa-clarita.com/city-hall/departments/community-development/planning-division/environmental-impact-reports-under-review/shadowbox-studios-project), as well as at the City Clerk's Office (in Santa Clarita City Hall) and at the Old Town Newhall Library. However, CEQA Guidelines Section 15148 also recognizes that the "preparation of EIRs is dependent upon information from many sources" and that "these documents should be cited but not included in the EIR." There is no requirement that all materials simply cited in an EIR be provided by the lead agency to potential reviewers throughout the entirety of the Draft EIR public review period.

Response to Comment No. O8-2

The comment claims that since the Planning Commission denied the request for extension of the public review of the Draft EIR, the City's CEQA process for the Project is flawed. The comment states that the public was not given adequate time or opportunity to provide meaningful comments. Please refer to Response to Comment No. O8-1 above for additional information regarding the City's public review process.

Response to Comment No. O8-3

The comment states that PCPOA does not necessarily oppose the concept of the Project because motion picture production has a history and continues to be part of Santa Clarita's character. However, the comment claims that the expansion of film production would impact the safety of Placerita Canyon residents and destroy the rural, equestrian-oriented environment of Placerita Canyon.

The comment makes general assertions that the Draft EIR is inadequate and that a meaningful public review and comment are precluded. However, this comment presents no other information or substantial evidence about the inadequacy of the Draft EIR. Accordingly, the comment is noted, and no additional response is warranted. Responses to the comment's specific points on the Draft EIR are provided below.

Response to Comment No. O8-4

The comment questions how a project of the magnitude proposed would have no significant environmental impacts, including impacts relating to the safety and environment of the residents of the Placerita Canyon Community, other than biological, cultural, and geological. The comment states that the Project is located in an area currently designated as residential under the City's General Plan and Zoning Ordinance. It should be noted that a large portion of the Project Site is zoned MXN (Mixed Use Neighborhood), and only the area north and a small area south of Placerita Creek are zoned NU5 (Non-Urban 5, one dwelling unit per acre). The Project is permitted in the MXN zone with approval of a Conditional Use Permit (CUP).

The comment also states that the Project is located adjacent to a neighborhood that, through careful planning and management, is a semi-rural equestrian setting. As discussed in Section 4.10, Land Use and Planning, of the Draft EIR, the Project would implement the following components in accordance with the provisions of the PCSSD:

- The Project would be internally and externally pedestrian-oriented with bicycle amenities and accommodations. The Project would construct a Class I trail along the Project frontage at 12th Street, Arch Street, and 13th Street and would be conditioned to either (1) pay an in-lieu fee to contribute toward improvements or (2) construct a connection to a future Class I trail along Railroad Avenue and future connection to the Jan Heidt Newhall

Metrolink Station and various retail, commercial, and entertainment uses in Old Town Newhall to promote a pedestrian friendly environment.

- The Project would include a defined entry gateway with landscaping and architectural elements with signage.
- The Project would utilize the MWD right-of-way behind the residences that front on Alderbrook Drive as a plant nursery, which would provide a transition between the residential uses immediately east of the Project Site and the Project.
- The majority of the Project's landscaping would use drought-tolerant trees.
- The proposed buildings would provide 360-degree architectural design with pedestrian-scaled building massing and forms.
- The Project would develop buildings with varied heights, ranging from 18 feet for the catering buildings to 55 feet for the sound stages, as permitted upon extension of the boundaries of the Jobs Creation Overlay Zone to incorporate the entire Project Site.

Furthermore, the Project would be required to undergo several City processes prior to Project approval, including architectural design review, development review, landscape plan review, and hillside review, to ensure that the Project complies with the requirements of the PCSSD and is compatible with the surrounding area, particularly the residential uses immediately east of the Project Site in Placerita Canyon.

In addition, the comment states that the Project is located in a historically high wildfire zone with very limited means of emergency ingress and egress, which will be dramatically limited by adding 2,500 vehicles at the mouth of the emergency egress point. However, as discussed on page 4.14-20 in Section 4.14, Transportation, of the Draft EIR, the off-site improvements proposed by the Project, including the widening of 12th Street, Arch Street, and 13th Street, would facilitate the evacuation of the Placerita Canyon area by reducing the evacuation congestion period at Arch Street and 12th Street; the traffic signalization of the intersection of 12th Street and Arch Street would provide for the most efficient traffic operations under an evacuation scenario. This conclusion is based on the Traffic Evacuation Assessment and corresponding evacuation modeling prepared for the Project and contained in Appendix N of the Draft EIR.

The comment cites a court case related to the provision of sufficient detail to allow for informed understanding of a project by the public and decision-makers. Overall, the comment does not identify any specific shortcomings of the Draft EIR analysis. The Draft EIR did not omit any critical information that would prohibit the decision-makers to make an informed decision on the Project. Further, the Draft EIR included sufficient detail to enable those who did not participate in its preparation to understand and to consider meaningfully the issues. The Appendices C through O of the Draft EIR contain numerous technical studies that provide detailed evaluations of the Project's potential impacts in various environmental topics. The analysis and conclusions of those technical studies are discussed in the corresponding sections of the Draft EIR, providing the reader with a summary of the technical study and directing the reader to the appropriate appendix for more technical information. The Draft EIR fully complied with all of CEQA's mandates, and the comment presents no information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR. The comment is noted for the record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O8-5

The comment claims that much of the analysis relating to traffic assumed that the Dockweiler improvement and extension will be completed before the Project is operational. It should be noted that the Project, which would implement off-site improvements, is not dependent on the completion of the Dockweiler Drive Extension Project. More specifically, the Project would implement the following off-site improvements, regardless of the timing of the Dockweiler Drive Extension Project:

- Widening of the rail crossing at 13th Street and Railroad Avenue;
- Widening of 13th Street, Arch Street, and 12th Street;
- Installation of a four-legged signalized intersection at 13th Street and Arch Street; and
- Installation of a four-legged signalized intersection at 12th Street and Arch Street.

If the Dockweiler Drive Extension Project is not completed prior to the completion of Project construction, the Project would be conditioned to extend Arch Street to Placerita Canyon Road and complete the two-legged intersection of Placerita Canyon Road and Arch Street, as indicated in the Tentative Tract Map included in Appendix B of the Draft EIR.

For further clarification, the second bullet on page 2.0-22 under Section 2.4.6, Off-Site Improvements, of the Draft EIR, was revised as follows (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this revision):

- Widening of 13th Street, Arch Street, and 12th Street and installation of traffic signals at the intersections of 13th Street and Arch Street and 12th Street and Arch Street;

In addition, the following was added to the fourth bullets on page 2.0-22 under Section 2.4.6, Off-Site Improvements, of the Draft EIR (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this addition):

- Required railroad crossing improvements at 13th Street that consist of the following:
  - Widening of the rail crossing at 13th Street and Railroad Avenue;

Furthermore, the following was added at the end of Section 2.4.6, Off-Site Improvements, on page 2.0-23 of the Draft EIR (see Section 3.0, Errata and Clarifications to the Draft EIR, of this Final EIR, for this addition):

> If the Dockweiler Drive Extension Project is not completed prior to the completion of Project construction, the Project would be conditioned to extend Arch Street to Placerita Canyon Road and complete the two-legged intersection of Placerita Canyon Road and Arch Street, as indicated in the Tentative Tract Map included in Appendix B of this Draft EIR.

Response to Comment No. O8-6

Emergency evacuation conditions were analyzed in a stand-alone technical study contained in Appendix L, Transportation Assessment, of the Draft EIR (Appendix H, Traffic Evacuation

Assessment for Shadowbox Studios Evacuation Shed Santa Clarita, California, January 20, 2023, prepared by GTC) that discussed the difference between existing evacuation conditions and evacuation conditions with the Project both without and with the roundabout and without and with the Dockweiler Drive Extension Project.

As discussed on page 4.14-20 in Section 4.14, Transportation, of the Draft EIR, the off-site improvements proposed by the Project, as identified in Response to Comment No. O8-5 above, would facilitate the evacuation of the Placerita Canyon area by reducing the evacuation congestion period at Arch Street and 12th Street; as such, the creation of an additional emergency ingress/egress route for Placerita Canyon is not warranted. In addition, the traffic signal intersection design would provide for the most efficient traffic operations, as well as accommodate horse trailers more easily, under an evacuation scenario. The 1-lane roundabout design would have less capacity for evacuation operations than a traffic signal and geometric constraints that do not accommodate horse trailers as easily.

The comment claims that omission of impacts related to emergency evacuation are disturbing and render the Draft EIR inadequate and flawed. However, the comment presents no additional information or substantial evidence regarding any omissions to render the Draft EIR inadequate and flawed. The comment is noted for the record and will be forwarded to the decision-makers for review and consideration.

Response to Comment No. O8-7

The comment correctly notes that the Project is subject to the Santa Clarita Community Character and Design Guidelines and intent of the guidelines. However, the comment incorrectly claims that the Draft EIR noted "that the current general plan and zoning designation for the Project Site, consistent with the Design Guidelines, is residential." The Draft EIR consistently identified the General Plan and zoning designation of the Project Site as MXN (Mixed Use Neighborhood) and NU5 (Non-Urban 5, one dwelling unit per acre) for the area north and a small area south of Placerita Creek. The Project is permitted in the MXN zone with approval of a CUP. While the Project Site is also located within the Placerita Canyon Special Standards District (PCSSD), there is nothing in the PCSSD that would preclude the Project Site from operating as a studio.

The comment correctly cites the Draft EIR regarding views from the east but fails to identify the next part of the sentence that the residential properties are separated from the Project site by an existing chain-link fencing, a 35-foot wide access road, and a row of mature trees. The comment also incorrectly claims that the Draft EIR analysis deftly limited the Project characteristics considered in the view analysis to the catering building and the facilities building. The Draft EIR correctly evaluated the Project as proposed, including all proposed buildings, structures, components, and landscaping. To evaluate a portion of the Project without considering the entire Project (e.g., without the nursery, landscaping, or fencing), as apparently suggested by the commenter, would be inconsistent with the requirements of CEQA. It should be noted that all the residences along Alderbrook Drive, with the exception of a two-story residence near its terminus, are single-story structures with an average height of 15 feet. With a 12-foot-tall security and perimeter fence and the sound stages, mechanical building, and catering buildings being set back from the eastern boundary of the Project Site by at least 300 feet (i.e., a distance of 335 feet from the property line of the residences along Alderbrook Drive), it is not physically and geometrically possible for the rooftops of the proposed structures, including the 55-foot-tall sound stages, to be visible from any of the residences along Alderbrook Drive, with the exception of the two-story residence, even without the nursery and landscaping. The

comment claims that the City acknowledged "that the Project will negatively impact the views from the sensitive viewing locations but puts forward the nursery, landscaping and fencing as supposedly mitigating the impact," which the City did not. The comment proceeds to claim that the despite the clear evidence, for which the comment does not provide substantiation, the Draft EIR found that no mitigation measures are required to protect sensitive viewing locations. The Draft EIR correctly determined that the proposed buildings would not be in the immediate view frame of the residences and would not be visually dominating.

Response to Comment No. O8-8

The comment claims that the analysis of impacts of the view from the residences to the east was limited to two, relatively small buildings. However, the Draft EIR clearly identified all the building on the eastern portion of the Project Site relative to views from the east, specifically in the first full paragraph on page 4.1.16 in Section 4.1, Aesthetics, of the Draft EIR. In addition, at over 700 feet, it is not physically and geometrically possible for the three-story office buildings and five-story parking structure to be visible from any of the residences along Alderbrook Drive. Accordingly, the Draft EIR correctly determined that all of the proposed buildings (i.e., not limited to the catering buildings and the mechanical building) would not be in the immediate view frame of the residences and would not be visually dominating. The comment presents no substantial evidence or information to support their claims. Accordingly, no further analysis is warranted.

Response to Comment No. O8-9

The comment states that the status quo is that the Project Site to remain designated for residential use under the General Plan and zoning ordinance and cited Table 5-1 in Section 5.0, Alternatives, of the Draft EIR. The comment claims that properly designed and developed housing on the Project Site would meet the current designation and could avoid the inherent conflict with the adjacent rural and equestrian-oriented neighborhood. In addition, the comment incorrectly claims that the Project would change the Project Site's land use designation from residential to industrial and that, by its very nature, creates a significant environmental impact particularly on the Placerita Canyon Community.

As noted in Response to Comment Nos. O8-4 and O8-7, a large portion of the Project Site is zoned MXN (Mixed Use Neighborhood), and only the area north and a small area south of Placerita Creek are zoned NU5 (Non-Urban 5, one dwelling unit per acre). The General Plan Amendment and Zone Change requested for the Project would not involve a change to industrial use as the studio use is permitted in the MXN zone with approval of a CUP.

In addition, contrary to the comment's claim a residential project would not avoid conflict with the adjacent rural and equestrian-oriented neighborhood. As presented in Section 5.0, Alternatives, of the Draft EIR, Alternative 2, which represents residential development consistent with the existing zoning of the Project Site, would result in lesser impacts related to biological resources, cultural resources, geology and soils, and tribal cultural resources. However, under Alternative 2, views along the eastern boundary of the Project Site would be more intense as the residences along Alderbrook Drive would have direct views of the residential buildings with heights up to 50 feet. Alternative 2 would also generate a greater number of daily trips and a higher VMT per capita than the Project. Correspondingly, a residential project would result in greater impacts related to air quality, energy, GHG emissions, hazards and hazardous materials (regarding wildfire), noise, population and housing, public services, transportation, utilities and service systems, and wildfire.

Response to Comment No. O8-10

The comment claims that there was no real analysis of the Project's consistency with the PCSSD and that the discussion was limited to a single block in Table 4.10-2. The comment also implies that the PCSSD standards would need to be amended to accommodate the Project. It should be noted that page 4.10-40 includes a discussion of the PCSSD. In addition, the Project is not requesting any amendments to the PCSSD standards. Please refer to Response to Comment No. O8-4 for a discussion of the Project features to be implemented by the Project in accordance with the provisions of the PCSSD. Furthermore, the Project would be required to undergo several City processes prior to Project approval, including architectural design review, development review, landscape plan review, and hillside review, to ensure that the Project complies with the requirements of the Placerita Canyon Special Standards District and is compatible with the surrounding area, particularly the residential uses immediately east of the Project Site in Placerita Canyon. Accordingly, the Draft EIR adequately addressed the Project's consistency with relevant plans, including the PCSSD standards.

Response to Comment No. O8-11

The comment claims that the compatibility analysis relating to the Placerita Canyon Community was omitted in the Draft EIR and that previously undisclosed new impacts are sufficient to require additional discussion and mitigation measures to trigger the requirement for recirculation of the EIR. It is not clear what new impacts to which the comment is referring that would constitute new information or substantial evidence that meets any of the criteria for recirculation of the Draft EIR. As discussed in Response to Comment No. O8-10, the Draft EIR adequately analyzed the Project's consistency with relevant plans, including the PCSSD standards.

Response to Comment No. O8-12

The comment claims that "the Project's location in the North Newhall Area already imposes the requirement of public participation and outreach to the Placerita Canyon Property Owners Association" is misleading as the City has not initiated working with the PCPOA to develop standards for new development. As stated in Response to Comment No. O8-10, the Project is not requesting any amendments to the PCSSD standards. As such, the requirement that the City and PCPOA work together to amend the PCSSD in the Unified Development Code is not applicable.

Please refer to Response to Comment No. O8-1 regarding the request to extend the time for public comment on the Draft EIR.

Response to Comment No. O8-13

The comment claims that the Draft EIR purported to consider whether the Project will be consistent with the Santa Clarita Municipal Code (SCMC) by referring to the limited "analysis" provided on page 4.10-39, which the comment alleges ignored anything to do with the character of the residential community. However, the comment failed to acknowledge the analysis of Project's consistency with the provisions of the PCSSD (SCMC Section 17.39.020), Oak Tree Permit (SCMC Section 17.23.170), Oak Tree Preservation (SCMC Section 17.51.040), and Ridgeline Alteration Permit (SCMC Section 17.26.130), as well as the Design Guidelines.

The comment correctly asserts that there is not an agreement with MWD for use of their property. No such agreement would be executed in advance of an approval for the Project and certification of the EIR; however, MWD has provided a letter to City Staff, upon their review of the Project plans, indicating the proposed grading and parking lot are generally acceptable and have

acknowledged the plant nursery. The Draft EIR appropriately acknowledged the Project's perimeter wall and proposed plant nursery because they are components of the applicant's proposal. The Draft EIR also acknowledged on page 2.0-20 in Section 2.0, Project Description, of the Draft EIR, that the development of the plant nursery is subject to an agreement with MWD.

Response to Comment No. O8-14

The comment states that the Draft EIR consistently equated project characteristics with mitigation and access that those characteristics will be in place, which makes for a flawed analysis. These project characteristics or project design features (PDFs) are features of the Project that would be included in the construction and operation of the Project that would be implemented above and beyond compliance with specific regulations and requirements. The description and inclusion of PDFs in the Draft EIR is not flawed, as alleged by the commenter, but rather aids in fulfilling the required contents of an EIR. CEQA Guidelines Section 15126.4, in particular, expresses that an EIR should discuss "the measures which are proposed by project proponents to be included in the project." Therefore, the inclusion of the PDFs is not considered mitigation because they are part of the construction design of the Project or proposed operation of the Project. Moreover, the conclusion that aesthetic impacts are less than significant is not dependent on the landscape nursery proposed in the MWD right-of-way. As discussed in Response to Comment No. O8-7, numerous factors contribute to this conclusion, including the existing chain-link fencing, a 35-foot wide access road, and a row of mature trees, as well as the setback to the proposed sound stages and parking structure and the line-of-sight from vantage points to the east. No changes to the Draft EIR are made based on this comment.

Response to Comment No. O8-15

The comment again makes an assertion that the EIR recognized the Project Site's current land use designation as residential and that the Project will remove nearly 10 percent of potential housing units available with the City. The City's 6th cycle Housing Element includes a detailed site inventory to ensure the City has adequate capacity to meet the regional housing needs. While the existing zoning on the Project Site could allow for the development of housing, the Project Site is not included in the site inventory of the City's Housing Element as a suitable housing site.

As stated in the City's General Plan Economic Development Element, the City seeks to enhance the quality of life for its residents by providing opportunities to work closer to home. The Project would create jobs in the entertainment industry, which is one of the City's four targeted industry sectors. Thus, the Project would have a cumulative positive contribution to employment in the Santa Clarita Valley, which is considered one of the housing-rich areas of Los Angeles County, as it would create more high-quality jobs for the City's residents.

The comment's states that, "employees living close to work is the key to the [Draft] EIR's very analysis of Transportation impacts because, in the [Draft] EIR's theory, those employees will be commuting by bicycle or municipal transit," which is incorrect. Rather, SCAG's RTP/SCS Regional Travel Demand Model was used to predict the geographic distribution of Project employees, which considers the regional distribution of both residential and employment land uses and estimates the most likely distribution of employees based on the regional pattern of employment opportunities.

Response to Comment No. O8-16

The comment questions the Draft EIR's statement that, "Rather than increase population growth in the City, it is anticipated that the employment growth would be filled by existing residents of the

City." However, the comment takes this statement out of context as it is not the basis for concluding that any environmental impacts related to population and housing are less than significant. Rather, the Draft EIR concludes that impacts related to population and housing would be less that significant because the Project would neither induce substantial unplanned population growth in an area, either directly or indirectly, nor displace substantial numbers of people or housing. Regarding potential population growth, pages 4.12-6 and 4.12-7 in Section 4.12, Population and Housing, of the Draft EIR, explain that the employment growth anticipated to result from the Project is within the level of employment growth planned for by the City's General Plan. The Economic Development Element of the General Plan establishes a goal of a 2 to 1 jobs/housing balance. The Project would aid the City in achieving this goal by increasing the City's jobs/housing ratio to 1.23 to 1 with the addition of the Project's anticipated 2,333 direct employment opportunities and potentially up to 1.28 to 1 with the addition of the Project's additional anticipated 3,500 indirect employment opportunities. Finally, the level of total City employment anticipated with the Project (98,361 to 101,861 jobs) is well within the "Employment Projections" described on page L-25 of the Land Use Element of the City's General Plan, which states that, "The estimated number of new jobs under General Plan build-out ranges from 98,322 to 128,850. Added to existing jobs within the Valley, the total number of jobs in the planning area is estimated to range from 217,910 to 286,254 at General Plan build-out." The Land Use Element states that approximately 60 percent of the jobs within the Santa Clarita Valley are within the City, which would equate to a total of 130,746 to 171,752 total jobs in the City of Santa Clarita at General Plan buildout. Please see also Response to Comment No. O8-15 above.

Response to Comment No. O8-17

The comment asserts that the conclusion of the Draft EIR that there are no significant transportation impacts is ridiculous and questions how adding a large project located along an already congested area will have no significant environmental impact without imposition of mitigation measures. The comment ignores the fact that the State of California, under Senate Bill (SB) 743, established new criteria for determining the significance of transportation impacts and defined alternative metrics for traffic level of service (LOS). SB 743 eliminated auto delay, LOS, and other similar measures of vehicular capacity or traffic congestion as the basis for determining significant impacts for land use projects in California. According to the legislative intent contained in SB 743, these changes to current practice were necessary to "more appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions." Specifically, CEQA Guidelines Section 15064.3 establishes vehicle miles traveled (VMT) as the most appropriate measure of transportation impacts. As such, the Transportation Assessment (Appendix L of the Draft EIR) followed the new State of California CEQA Guidelines, as well as the methodology established in the City's *Transportation Analysis Updates in Santa Clarita* (TAU).

Response to Comment No. O8-18

The comment refers to and incorporates comments from Mr. Alex Tabrizi with MAT Engineering. Please refer to Response to Comment Nos. O8-32 to O8-67, which address Mr. Tabrizi's comments regarding his peer review of the transportation/traffic analysis and parking analysis study for the Project.

Response to Comment No. O8-19

The comment claims that there are some problems with the Transportation analysis in the Draft EIR, the first as to whether the Project will be conditioned on the completion of the necessary road improvements, particularly the Dockweiler Drive Extension Project. Please refer to Response to Comment No. O8-5 above.

Response to Comment No. O8-20

The comment notes that the Draft EIR finding of "no impacts" is inconsistent with the traffic study regarding impacts to levels of service. Please refer to Response to Comment No. O8-17 above. However, in addition to the VMT analysis, the City of Santa Clarita also requires a non-CEQA analysis of intersection performance and defines an "affected intersection" as follows:

> Based on thresholds determined using criteria established by the City, an intersection would be considered affected by Project-generated traffic if the Project would do any of the following:
>
> - Worsen an intersection maintained by the City from LOS D or better to LOS E or F or
